Data Sheet *(Retired Product)*

This product has been retired and is not recommended for new designs. Availability of this document is retained for reference and historical purposes only.

Continuity of Specifications

There is no change to this data sheet as a result of offering the device as a Spansion product. Any changes that have been made are the result of normal data sheet improvement and are noted in the document revision summary.

For More Information

Please contact your local sales office for additional information about Spansion memory solutions.

Publication Number MBM29LV160T/MBM29LV160B **Revision** DS05-20846-7E **Issue Date** July 26, 2007

SPANSION™ Flash Memory

Data Sheet

September 2003

This document specifies SPANSION™ memory products that are now offered by both Advanced Micro Devices and Fujitsu. Although the document is marked with the name of the company that originally developed the specification, these products will be offered to customers of both AMD and Fujitsu.

Continuity of Specifications

There is no change to this datasheet as a result of offering the device as a SPANSION™ product. Future routine revisions will occur when appropriate, and changes will be noted in a revision summary.

Continuity of Ordering Part Numbers

AMD and Fujitsu continue to support existing part numbers beginning with "Am" and "MBM". To order these products, please use only the Ordering Part Numbers listed in this document.

For More Information

Please contact your local AMD or Fujitsu sales office for additional information about SPANSION™ memory solutions.

FLASH MEMORY

CMOS

16M (2M × 8/1M × 16) BIT

MBM29LV160T-80/-90/-12/MBM29LV160B-80/-90/-12

■ GENERAL DESCRIPTION

The MBM29LV160T/B is a 16M-bit, 3.0 V-only Flash memory organized as 2M bytes of 8 bits each or 1M words of 16 bits each. The MBM29LV160T/B is offered in a 48-pin TSOP (1), 48-pin CSOP and 48-ball FBGA packages. The device is designed to be programmed in-system with the standard system 3.0 V V_{CC} supply. 12.0 V V_{PP} and 5.0 V V_{CC} are not required for write or erase operations. The device can also be reprogrammed in standard EPROM programmers.

The standard MBM29LV160T/B offers access times of 80 ns and 120 ns, allowing operation of high-speed microprocessors without wait states. To eliminate bus contention the device has separate chip enable ($\overline{CE}$), write enable ($\overline{WE}$), and output enable ($\overline{OE}$) controls.

The MBM29LV160T/B is pin and command set compatible with JEDEC standard E^2PROMs. Commands are written to the command register using standard microprocessor write timings. Register contents serve as input to an internal state-machine which controls the erase and programming circuitry. Write cycles also internally latch addresses and data needed for the programming and erase operations. Reading data out of the device is similar to reading from 5.0 V and 12.0 V Flash or EPROM devices.

The MBM29LV160T/B is programmed by executing the program command sequence. This will invoke the Embedded Program Algorithm which is an internal algorithm that automatically times the program pulse widths and verifies proper cell margins. Typically, each sector can be programmed and verified in about 0.5 seconds. Erase is accomplished by executing the erase command sequence. This will invoke the Embedded Erase Algorithm which is an internal algorithm that automatically preprograms the array if it is not already programmed before executing the erase operation. During erase, the device automatically times the erase pulse widths and verifies proper cell margins.

■ PRODUCT LINE UP

Part No.		MBM29LV160T/160B		
Ordering Part No.	V_{CC} = 3.3 V $^{+0.3\ V}_{-0.3\ V}$	-80	—	—
	V_{CC} = 3.0 V $^{+0.6\ V}_{-0.3\ V}$	—	-90	-12
Max Address Access Time (ns)		80	90	120
Max $\overline{CE}$ Access Time (ns)		80	90	120
Max $\overline{OE}$ Access Time (ns)		30	35	50

(Continued)

Any individual sector is typically erased and verified in 1.0 second. (If already preprogrammed.)

The device also features a sector erase architecture. The sector mode allows each sector to be erased and reprogrammed without affecting other sectors. The MBM29LV160T/B is erased when shipped from the factory.

The device features single 3.0 V power supply operation for both read and write functions. Internally generated and regulated voltages are provided for the program and erase operations. A low V_{CC} detector automatically inhibits write operations on the loss of power. The end of program or erase is detected by $\overline{\text{Data}}$ Polling of DQ_7, by the Toggle Bit feature on DQ_6, or the RY/$\overline{\text{BY}}$ output pin. Once the end of a program or erase cycle has been comleted, the device internally resets to the read mode.

The MBM29LV160T/B also has a hardware $\overline{\text{RESET}}$ pin. When this pin is driven low, execution of any Embedded Program Algorithm or Embedded Erase Algorithm is terminated. The internal state machine is then reset to the read mode. The $\overline{\text{RESET}}$ pin may be tied to the system reset circuitry. Therefore, if a system reset occurs during the Embedded Program Algorithm or Embedded Erase Algorithm, the device is automatically reset to the read mode and will have erroneous data stored in the address locations being programmed or erased. These locations need re-writing after the Reset. Resetting the device enables the system's microprocessor to read the boot-up firmware from the Flash memory.

Fujitsu's Flash technology combines years of Flash memory manufacturing experience to produce the highest levels of quality, reliability, and cost effectiveness. The MBM29LV160T/B memory electrically erases all bits within a sector simultaneously via Fowler-Nordhiem tunneling. The bytes/words are programmed one byte/word at a time using the EPROM programming mechanism of hot electron injection.

■ FEATURES

- **Single 3.0 V read, program and erase**
  Minimizes system level power requirements
- **Compatible with JEDEC-standard commands**
  Uses same software commands as E^2PROMs
- **Compatible with JEDEC-standard world-wide pinouts**
  48-pin TSOP (1) (Package suffix: PFTN-Normal Bend Type, PFTR-Reversed Bend Type)
  48-pin CSOP (Package suffix: PCV)
  48-ball FBGA (Package suffix: PBT)
- **Minimum 100,000 program/erase cycles**
- **High performance**
  80 ns maximum access time
- **Sector erase architecture**
  One 8K word, two 4K words, one 16K word, and thirty-one 32K words sectors in word mode
  One 16K byte, two 8K bytes, one 32K byte, and thirty-one 64K bytes sectors in byte mode
  Any combination of sectors can be concurrently erased. Also supports full chip erase
- **Boot Code Sector Architecture**
  T = Top sector
  B = Bottom sector
- **Embedded Erase™* Algorithms**
  Automatically pre-programs and erases the chip or any sector
- **Embedded program™* Algorithms**
  Automatically programs and verifies data at specified address
- **$\overline{\text{Data}}$ Polling and Toggle Bit feature for detection of program or erase cycle completion**
- **Ready/Busy output (RY/$\overline{\text{BY}}$)**
  Hardware method for detection of program or erase cycle completion

(Continued)

(Continued)

- **Automatic sleep mode**
  When addresses remain stable, automatically switches themselves to low power mode
- **Low V_{CC} write inhibit ≤ 2.5 V**
- **Erase Suspend/Resume**
  Suspends the erase operation to allow a read data and/or program in another sector within the same device
- **Sector protection**
  Hardware method disables any combination of sectors from program or erase operations
- **Sector Protection set function by Extended sector Protect command**
- **Fast Programming Function by Extended Command**
- **Temporary sector unprotection**
  Temporary sector unprotection via the $\overline{\text{RESET}}$ pin
- **In accordance with CFI (Common Flash Memory Interface)**

	Byte		AAAh		555h		AAAh							
Byte/Word Program *3, *4	Word	4	555h	AAh	2AAh	55h	555h	A0h	PA	PD	—	—	—	—
	Byte		AAAh		555h		AAAh							
Chip Erase	Word	6	555h	AAh	2AAh	55h	555h	80h	555h	AAh	2AAh	55h	555h	10h
	Byte		AAAh		555h		AAAh		AAAh		555h		AAh	
Sector Erase *3	Word	6	555h	AAh	2AAh	55h	555h	80h	555h	AAh	2AAh	55h	SA	30h
	Byte		AAAh		555h		AAAh		AAAh		555h			
Sector Erase Suspend	Word /Byte	1	XXXh	B0h	—	—	—	—	—	—	—	—	—	—
Sector Erase Resume	Word /Byte	1	XXXh	30h	—	—	—	—	—	—	—	—	—	—

*1: Address bits A_{19} to A_{11} = X = “H” or “L” for all address commands except or Program Address (PA) and Sector Address (SA).

*2: Bus operations are defined in “MBM29LV160T/B User Bus Operation Tables ($\overline{BYTE}$ = V_{IH} and $\overline{BYTE}$ = V_{IL})”.

*3: RA= Address of the memory location to be read.
PA = Address of the memory location to be programmed. Addresses are latched on the falling edge of the $\overline{WE}$ pulse.
SA= Address of the sector to be erased. The combination of A_{19}, A_{18}, A_{17}, A_{16}, A_{15}, A_{14}, A_{13}, and A_{12} will uniquely select any sector.

*4: RD= Data read from location RA during read operation.
PD= Data to be programmed at location PA. Data is latched on the rising edge of $\overline{WE}$.

*5: The system should generate the following address patterns:
Word Mode: 555h or 2AAh to addresses A_{10} to A_0
Byte Mode: AAAh or 555h to addresses A_{10} to A_{-1}

*6: Both Read/Reset commands are functionally equivalent, resetting the device to the read mode.

Note: The command combinations not described in “MBM29LV160T/B Standard Command Definitions” and “MBM29LV160T/B Extended Command Definitions” are illegal.

MBM29LV160T/B Extended Command Definitions Table

Command Sequence		Bus Write Cycles Req'd	First Bus Write Cycle		Second Bus Write Cycle		Third Bus Write Cycle		Fourth Bus Read Cycle	
			Addr	Data	Addr	Data	Addr	Data	Addr	Data
Set to Fast Mode	Word	3	555h	AAh	2AAh	55h	555h	20h	—	—
	Byte		AAAh		555h		AAAh			
Fast Program *1	Word	2	XXXh	A0h	PA	PD	—	—	—	—
	Byte		XXXh							
Reset from Fast Mode *1	Word	2	XXXh	90h	XXXh	F0h *4	—	—	—	—
	Byte		XXXh		XXXh					
Query Command *2	Word	2	55h	98h	—	—	—	—	—	—
	Byte		AAh							
Extended Sector Protect *3	Word	4	XXXh	60h	SPA	60h	SPA	40h	SPA	SD
	Byte									

SPA : Sector Address to be protected. Set sector address (SA) and (A_6, A_1, A_0) = (0, 1, 0).

SD : Sector protection verify data. Output 01h at protected sector addresses and output 00h at unprotected sector addresses.

*1 : This command is valid during fast mode.

*2 : The valid addresses are A_6 to A_0. The other addresses are “Don’t care”.

*3 : This command is valid while V_{ID} = $\overline{\text{RESET}}$.

*4 : The data “00h” is also acceptable.

MBM29LV160T/B Sector Protection Verify Autoselect Code Table

Type			A_{19} to A_{12}	A_6	A_1	A_0	A_{-1}*1	Code (HEX)
Manufacture's Code			X	V_{IL}	V_{IL}	V_{IL}	V_{IL}	04h
Device Code	MBM29LV160T	Byte	X	V_{IL}	V_{IL}	V_{IH}	V_{IL}	C4h
		Word					X	22C4h
	MBM29LV160B	Byte	X	V_{IL}	V_{IL}	V_{IH}	V_{IL}	49h
		Word					X	2249h
Sector Protection			Sector Addresses	V_{IL}	V_{IH}	V_{IL}	V_{IL}	01h*2

*1: A_{-1} is for Byte mode. At Byte mode, DQ_{14} to DQ_8 are High-Z and DQ_{15} is A_{-1}, the lowest address.

*2: Outputs 01h at protected sector addresses and outputs 00h at unprotected sector addresses.

Extended Autoselect Code Table

Type			Code	DQ_{15}	DQ_{14}	DQ_{13}	DQ_{12}	DQ_{11}	DQ_{10}	DQ_9	DQ_8	DQ_7	DQ_6	DQ_5	DQ_4	DQ_3	DQ_2	DQ_1	DQ_0
Manufacture's Code			04h	A_{-1}/0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
Device Code	MBM29LV160T	(B)*	C4h	A_{-1}	HI-Z	HI-Z	HI-Z	HI-Z	HI-Z	HI-Z	HI-Z	1	1	0	0	0	1	0	0
		(W)	22C4h	0	0	1	0	0	0	1	0	1	1	0	0	0	1	0	0
	MBM29LV160B	(B)*	49h	A_{-1}	HI-Z	HI-Z	HI-Z	HI-Z	HI-Z	HI-Z	HI-Z	0	1	0	0	1	0	0	1
		(W)	2249h	0	0	1	0	0	0	1	0	0	1	0	0	1	0	0	1
Sector Protection			01h	A_{-1}/0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

(B): Byte mode
(W): Word mode
HI-Z : High-Z

* : At Byte mode, DQ_{14} to DQ_8 are High-Z and DQ_{15} is A_{-1}, the lowest address.

■ FLEXIBLE SECTOR-ERASE ARCHITECTURE

- One 8K word, two 4K words, one 16K word, and thirty-one 32K words sectors in word mode.
- One 16K byte, two 8K bytes, one 32K byte, and thirty-one 64K bytes sectors in byte mode.
- Individual-sector, multiple-sector, or bulk-erase capability.
- Individual or multiple-sector protection is user definable.

■ FUNCTIONAL DESCRIPTION

Read Mode

The MBM29LV160T/B has two control functions which must be satisfied in order to obtain data at the outputs. $\overline{CE}$ is the power control and should be used for a device selection. $\overline{OE}$ is the output control and should be used to gate data to the output pins if a device is selected.

Address access time (t_{ACC}) is equal to the delay from stable addresses to valid output data. The chip enable access time (t_{CE}) is the delay from stable addresses and stable $\overline{CE}$ to valid data at the output pins. The output enable access time is the delay from the falling edge of $\overline{OE}$ to valid data at the output pins. (Assuming the addresses have been stable for at least t_{ACC} - t_{OE} time.) See “(1) AC Waveforms for Read Operations” in ■TIMING DIAGRAM for timing specifications.

Standby Mode

There are two ways to implement the standby mode on the MBM29LV160T/B devices. One is by using both the $\overline{CE}$ and $\overline{RESET}$ pins; the other via the $\overline{RESET}$ pin only.

When using both pins, a CMOS standby mode is achieved with $\overline{CE}$ and $\overline{RESET}$ inputs both held at V_{CC} ±0.3 V. Under this condition the current consumed is less than 5 μA Max. During Embedded Algorithm operation, V_{CC} Active current (I_{CC2}) is required even $\overline{CE}$ = “H”. The device can be read with standard access time (t_{CE}) from either of these standby modes.

When using the $\overline{RESET}$ pin only, a CMOS standby mode is achieved with the $\overline{RESET}$ input held at V_{SS} ±0.3 V ($\overline{CE}$ = “H” or “L”). Under this condition the current consumed is less than 5 μA Max. Once the $\overline{RESET}$ pin is taken high, the device requires t_{RH} of wake up time before outputs are valid for read access.

In the standby mode, the outputs are in the high-impedance state, independent of the $\overline{OE}$ input.

Automatic Sleep Mode

There is a function called automatic sleep mode to restrain power consumption during read-out of MBM29LV160T/B data. This mode can be used effectively with an application requesting low power consumption such as handy terminals.

To activate this mode, MBM29LV160T/B automatically switches itself to low power mode when addresses remain stable for 150 ns. It is not necessary to control $\overline{CE}$, $\overline{WE}$, and $\overline{OE}$ in this mode. During such mode, the current consumed is typically 1 μA (CMOS Level).

Standard address access timings provide new data when addresses are changed. While in sleep mode, output data is latched and always available to the system.

Output Disable

If the $\overline{OE}$ input is at a logic high level (V_{IH}), output from the device is disabled. This will cause the output pins to be in a high-impedance state.

Autoselect

The Autoselect mode allows the reading out of a binary code from the device and will identify its manufacturer and type. The intent is to allow programming equipment to automatically match the device to be programmed with its corresponding programming algorithm. The Autoselect command may also be used to check the status of write-protected sectors. (See “MBM29LV160T/B Sector Protection Verify Autoselect Code Table” and “Extended Autoselect Code Table” in ■DEVICE BUS OPERATION.) This mode is functional over the entire temperature range of the device.

To activate this mode, the programming equipment must force V_{ID} (11.5 V to 12.5 V) on address pin A_9. Two identifier bytes may then be sequenced from the devices outputs by toggling address A_0 from V_{IL} to V_{IH}. All addresses are DON’T CARES except A_0, A_1, and A_6 (A_{-1}). (See “MBM29LV160T/B User Bus Operation Tables ($\overline{BYTE}$ = V_{IH} or $\overline{BYTE}$ = V_{IL}) ” in ■DEVICE BUS OPERATION.)

The manufacturer and device codes may also be read via the command register, for instances when the MBM29LV160T/B is erased or programmed in a system without access to high voltage on the A_9 pin. The command sequence is illustrated in “MBM29LV160T/B Standard Command Definitions Table” in ■DEVICE BUS OPERATION.

Byte 0 ($A_0 = V_{IL}$) represents the manufacture's code and byte 1 ($A_0 = V_{IH}$) represents the device identifier code. For the MBM29LV160T/B these two bytes are given in "Extended Autoselect Code Table" (in ■DEVICE BUS OPERATION). All identifiers for manufactures and device will exhibit odd parity with DQ_7 defined as the parity bit. In order to read the proper device codes when executing the Autoselect, A_1 must be V_{IL}. (See "MBM29LV160T/B User Bus Operation Tables ($\overline{BYTE} = V_{IH}$ and $\overline{BYTE} = V_{IL}$)" in ■DEVICE BUS OPERATION.) For device indentification in word mode ($\overline{BYTE} = V_{IH}$), DQ_9 and DQ_{13} are equal to '1' and DQ_{15}, DQ_{14}, DQ_{12} to DQ_{10} and DQ_8 are equal to '0'.

If $\overline{BYTE} = V_{IL}$ (for byte mode), the device code is C4h (for top boot block) or 49h (for bottom boot block).
If $\overline{BYTE} = V_{IH}$ (for word mode), the device code is 22C4h (for top boot block) or 2249h (for bottom boot block).

In order to determine which sectors are write protected, A_1 must be at V_{IH} while running through the sector addresses; if the selected sector is protected, a logical '1' will be output on DQ_0 (DQ_0 =1).

Write

Device erasure and programming are accomplished via the command register. The command register is written by bringing $\overline{WE}$ to V_{IL}, while $\overline{CE}$ is at V_{IL} and $\overline{OE}$ is at V_{IH}. Addresses are latched on the falling edge of $\overline{CE}$ or $\overline{WE}$, whichever occurs later, while data is latched on the rising edge of $\overline{CE}$ or $\overline{WE}$ pulse, whichever occurs first. Standard microprocessor write timings are used. See "(3) AC Waveforms for Alternate $\overline{WE}$ Controlled Program Operations" and "(4) AC Waveforms for Alternate $\overline{CE}$ Controlled Program Operations" and "(5) AC Waveforms for Chip/Sector Erase Operations" in ■TIMING DIAGRAM.

Refer to AC Write Characteristics and the Erase/Programming Waveforms for specific timing parameters.

Sector Protection

The MBM29LV160T/B features hardware sector protection. This feature will disable both program and erase operations in any number of sectors (0 through 34). The sector protection feature is enabled using programming equipment at the user's site. The device is shipped with all sectors unprotected.

To activate this mode, the programming equipment must force V_{ID} on address pin A_9 and control pin $\overline{OE}$, $\overline{CE} = V_{IL}$, $A_0 = A_6 = V_{IL}$, $A_1 = V_{IH}$. The sector addresses pins (A_{19}, A_{18}, A_{17}, A_{16}, A_{15}, A_{14}, A_{13}, and A_{12}) should be set to the sector to be protected. "Sector Address Tables (MBM29LV160T/B)" in ■FLEXIBLE SECTOR-ERASE ARCHITECTURE define the sector address for each of the thirty five (35) individual sectors. Programming of the protection circuitry begins on the falling edge of the $\overline{WE}$ pulse and is terminated with the rising edge of the same. Sector addresses must be held constant during the $\overline{WE}$ pulse. See "(13) AC Waveforms for Sector Protection Timing Diagram" in ■TIMING DIAGRAM and "(5) Sector Protection Algorithm" in ■FLOW CHART for sector protection waveforms and algorithm.

To verify programming of the protection circuitry, the programming equipment must force V_{ID} on address pin A_9 with $\overline{CE}$ and $\overline{OE}$ at V_{IL} and $\overline{WE}$ at V_{IH}. Scanning the sector addresses (A_{19}, A_{18}, A_{17}, A_{16}, A_{15}, A_{14}, A_{13}, and A_{12}) while (A_6, A_1, A_0) = (0, 1, 0) will produce a logical "1" at device output DQ_0 for a protected sector. Otherwise the device will read 00h for an unprotected sector. In this mode, the lower order addresses, except for A_0, A_1, and A_6 are DON'T CARES. Address locations with $A_1 = V_{IL}$ are reserved for Autoselect manufacturer and device codes. A_{-1} requires to V_{IL} in byte mode.

It is also possible to determine if a sector is protected in the system by writing an Autoselect command. Performing a read operation at the address location XX02h, where the higher order addresses pins (A_{19}, A_{18}, A_{17}, A_{16}, A_{15}, A_{14}, A_{13}, and A_{12}) represents the sector address will produce a logical "1" at DQ_0 for a protected sector. See "MBM29LV160T/B Sector Protection Verify Autoselect Code Table" and "Extended Autoselect Code Table" in ■DEVICE BUS OPERATION for Autoselect codes.

Temporary Sector Unprotection

This feature allows temporary unprotection of previously protected sectors of the MBM29LV160T/B devices in order to change data. The Sector Unprotection mode is activated by setting the $\overline{RESET}$ pin to high voltage (12 V). During this mode, formerly protected sectors can be programmed or erased by selecting the sector addresses. Once the 12 V is taken away from the $\overline{RESET}$ pin, all the previously protected sectors will be protected again. (See "(15) Temporary Sector Unprotection Timing Diagram" in ■TIMING DIAGRAM and "(6) Temporary Sector Unprotection Algorithm" in ■FLOW CHART.)

■ COMMAND DEFINITIONS

Device operations are selected by writing specific address and data sequences into the command register. Writing incorrect address and data values or writing them in an improper sequence will reset the device to the read mode. “MBM29LV160T/B Standard Command Definitions” in ■DEVICE BUS OPERATION defines the valid register command sequences. Note that the Erase Suspend (B0h) and Erase Resume (30h) commands are valid only while the Sector Erase operation is in progress. Moreover both Read/Reset commands are functionally equivalent, resetting the device to the read mode. Please note that commands are always written at DQ_7 to DQ_0 and DQ_{15} to DQ_8 bits are ignored.

Read/Reset Command

In order to return from Autoselect mode or Exceeded Timing Limits (DQ_5 = 1) to read mode, the read/reset operation is initiated by writing the Read/Reset command sequence into the command register. Microprocessor read cycles retrieve array data from the memory. The device remains enabled for reads until the command register contents are altered.

The device will automatically power-up in the Read/Reset state. In this case, a command sequence is not required to read data. Standard microprocessor read cycles will retrieve array data. This default value ensures that no spurious alteration of the memory contents occurs during the power transition. Refer to the AC Read Characteristics and Waveforms for specific timing parameters. (See “(1) AC Waveforms for Read Operations” in ■TIMING DIAGRAM.)

Autoselect Command

Flash memories are intended for use in applications where the local CPU alters memory contents. As such, manufactures and device codes must be accessible while the device resides in the target system. PROM programmers typically access the signature codes by raising A_9 to a high voltage. However, multiplexing high voltage onto the address lines is not generally desired system design practice.

The device contains an Autoselect command operation to supplement traditional PROM programming methodology. The operation is initiated by writing the Autoselect command sequence into the command register. Following the last command write, a read cycle from address XX00h retrieves the manufacture code of 04h. A read cycle from address XX01h for ×16 (XX02h for ×8) retrieves the device code (MBM29LV160T = C4h and MBM29LV160B = 49h for ×8 mode; MBM29LV160T = 22C4h and MBM29LV160B = 2249h for ×16 mode). (See “MBM29LV160T/B Sector Protection Verify Autoselect Code Table” and “Extended Autoselect Code Table” in ■DEVICE BUS OPERATION.)

All manufactures and device codes will exhibit odd parity with DQ_7 defined as the parity bit.
The sector state (protection or unprotection) will be indicated by address XX02h for ×16 (XX04h for ×8). Scanning the sector addresses (A_{19}, A_{18}, A_{17}, A_{16}, A_{15}, A_{14}, A_{13}, and A_{12}) while (A_6, A_1, A_0) = (0, 1, 0) will produce a logical “1” at device output DQ_0 for a protected sector. The programming verification should be perform margin mode verification on the protected sector. (See “MBM29LV160T/B User Bus Operation Tables ($\overline{BYTE}$ = V_{IH} and $\overline{BYTE}$ = V_{IL})” in ■DEVICE BUS OPERATION.)

To terminate the operation, it is necessary to write the Read/Reset command sequence into the register and, also to write the Autoselect command during the operation, by executing it after writing the Read/Reset command sequence.

Word/Byte Programming

The device is programmed on a byte-by-byte (or word-by-word) basis. Programming is a four bus cycle operation. There are two “unlock” write cycles. These are followed by the program set-up command and data write cycles. Addresses are latched on the falling edge of $\overline{CE}$ or $\overline{WE}$, whichever happens later and the data is latched on the rising edge of $\overline{CE}$ or $\overline{WE}$, whichever happens first. The rising edge of the last $\overline{CE}$ or $\overline{WE}$ (whichever happens first) begins programming. Upon executing the Embedded Program Algorithm command sequence, the system is not required to provide further controls or timings. The device will automatically provide adequate internally generated program pulses and verify the programmed cell margin. (See “(3) AC Waveforms for Alternate $\overline{WE}$ Controlled Program Operations” and “(4) AC Waveforms for Alternate $\overline{CE}$ Controlled Program Operations” in ■TIMING DIAGRAM.)

The automatic programming operation is completed when the data on DQ_7 is equivalent to data written to this bit at which time the device return to the read mode and addresses are no longer latched. (See “Hardware Sequence Flags Table”.) Therefore, the device requires that a valid address be supplied by the system at this time. Hence, $\overline{\text{Data}}$ Polling must be performed at the memory location which is being programmed.

Any commands written to the chip during this period will be ignored. If hardware reset occures during the programming operation, it is impossible to guarantee whether the data being written is correct or not.

Programming is allowed in any sequence and across sector boundaries. Beware that a data “0” cannot be programmed back to a “1”. Attempting to do so may either hang up the device or result in an apparent success according to the data polling algorithm but a read from read/reset mode will show that the data is still “0”. Only erase operations can convert “0”s to “1”s.

“(1) Embedded Program™ Algorithm” in ■FLOW CHART illustrates the Embedded Program™ Algorithm using typical command strings and bus operations.

Chip Erase

Chip erase is a six-bus cycle operation. There are two “unlock” write cycles. These are followed by writing the “set-up” command. Two more “unlock” write cycles are then followed by the chip erase command.

Chip erase does not require the user to program the device prior to erase. Upon executing the Embedded Erase Algorithm command sequence the device will automatically program and verify the entire memory for an all zero data pattern prior to electrical erase. (Preprogram Function.) The system is not required to provide any controls or timings during these operations.

The automatic erase begins on the rising edge of the last $\overline{\text{WE}}$ pulse in the command sequence and terminates when the data on DQ_7 is “1” (See Write Operation Status section.) at which time the device returns to read mode. (See “(5) AC Waveforms for Chip/Sector Erase Operations” in ■TIMING DIAGRAM.)

“(2) Embedded Erase™ Algorithm” in ■FLOW CHART illustrates the Embedded Erase™ Algorithm using typical command strings and bus operations.

Sector Erase

Sector erase is a six-bus cycle operation. There are two “unlock” write cycles, followed by writing the “set-up” command. Two more “unlock” write cycles are then followed by the Sector Erase command. The sector address (any address location within the desired sector) is latched on the falling edge of $\overline{\text{WE}}$, while the command (Data = 30h) is latched on the rising edge of $\overline{\text{WE}}$. After a time-out of 50 μs from the rising edge of the last sector erase command, the sector erase operation will begin.

Multiple sectors may be erased concurrently by writing six-bus cycle operations on “MBM29LV160T/B Standard Command Definitions” in ■DEVICE BUS OPERATION. This sequence is followed with writes of the Sector Erase command to addresses in other sectors desired to be concurrently erased. The time between writes must be less than 50 μs otherwise that command will not be accepted and erasure will start. It is recommended that processor interrupts be disabled during this time to guarantee this condition. The interrupts can be re-enabled after the last Sector Erase command is written. A time-out of 50 μs from the rising edge of the last $\overline{\text{WE}}$ will initiate the execution of the Sector Erase command(s). If another falling edge of the $\overline{\text{WE}}$ occurs within the 50 μs time-out window the timer is reset. Monitor DQ_3 to determine if the sector erase timer window is still open. (See section DQ_3, Sector Erase Timer.) Any command other than Sector Erase or Erase Suspend during this time-out period will reset the device to the read mode, ignoring the previous command string. Resetting the device once excution has begun will corrupt the data in the sector. In that case, restart the erase on those sectors and allow them to complete. (Refer to the Write Operation Status section for Sector Erase Timer operation.) Loading the sector erase buffer may be done in any sequence and with any number of sectors (0 to 34).

Sector erase does not require the user to program the device prior to erase. The device automatically programs all memory locations in the sector(s) to be erased prior to electrical erase (Preprogram Function). When erasing a sector or sectors the remaining unselected sectors are not affected. The system is not required to provide any controls or timings during these operations. (See “(5) AC Waveforms for Chip/Sector Erase Operations” in ■TIMING DIAGRAM.)

The automatic sector erase begins after the 50 μs time out from the rising edge of the $\overline{WE}$ pulse for the last sector erase command pulse and terminates when the data on DQ_7 is "1" (See Write Operation Status section) at which time the device returns to the read mode. $\overline{Data}$ polling must be performed at an address within any of the sectors being erased. Multiple Sector Erase Time; [Sector Program Time (Preprogramming) + Sector Erase Time] × Number of Sector Erase.

"(2) Embedded Erase™ Algorithm" in ■FLOW CHART illustrates the Embedded Erase™ Algorithm using typical command strings and bus operations.

Erase Suspend/Resume

The Erase Suspend command allows the user to interrupt a Sector Erase operation and then perform data reads from or program to a sector not being erased. This command is applicable ONLY during the Sector Erase operation which includes the time-out period for sector erase. The Erase Suspend command will be ignored if written during the Chip Erase operation or Embedded Program Algorithm. Writting the Erase Suspend command during the Sector Erase time-out results in immediate termination of the time-out period and suspension of the erase operation.

Writing the Erase Resume command resumes the erase operation. The addresses are "DON'T CARES" when writing the Erase Suspend or Erase Resume commands.

When the Erase Suspend command is written during the Sector Erase operation, the device will take a maximum of 20 μs to suspend the erase operation. When the devices have entered the erase-suspended mode, the RY/$\overline{BY}$ output pin and the DQ_7 bit will be at logic "1", and DQ_6 will stop toggling. The user must use the address of the erasing sector for reading DQ_6 and DQ_7 to determine if the erase operation has been suspended. Further writes of the Erase Suspend command are ignored.

When the erase operation has been suspended, the device defaults to the erase-suspend-read mode. Reading data in this mode is the same as reading from the standard read mode except that the data must be read from sectors that have not been erase-suspended. Successively reading from the erase-suspended sector while the device is in the erase-suspend-read mode will cause DQ_2 to toggle. (See the section on DQ_2.)

After entering the erase-suspend-read mode, the user can program the device by writing the appropriate command sequence for Program. This Program mode is known as the erase-suspend-program mode. Again, programming in this mode is the same as programming in the regular Program mode except that the data must be programmed to sectors that are not erase-suspended. Successively reading from the erase-suspended sector while the devices are in the erase-suspend-program mode will cause DQ_2 to toggle. The end of the erase-suspended Program operation is detected by the RY/$\overline{BY}$ output pin, $\overline{Data}$ polling of DQ_7, or the Toggle Bit (DQ_6) which is the same as the regular Program operation. Note that DQ_7 must be read from the Program address while DQ_6 can be read from any address.

To resume the operation of Sector Erase, the Resume command (30h) should be written. Any further writes of the Resume command at this point will be ignored. Another Erase Suspend command can be written after the chip has resumed erasing.

Extended Command

(1) Fast Mode

MBM29LV160T/B has Fast Mode function. This mode dispenses with the initial two unlock cycles required in the standard program command sequence writing Fast Mode command into the command register. In this mode, the required bus cycle for programming is two cycles instead of four bus cycles in standard program command. The read operation is also executed after exiting this mode. During the Fast mode, do not write any command other than the Fast program/Fast mode reset command. To exit this mode, it is necessary to write Fast Mode Reset command into the command register. (Refer to "(7) Embedded Programming Algorithm for Fast Mode" in ■FLOW CHART.) The V_{CC} active current is required even $\overline{CE}$ = V_{IH} during Fast Mode.

(2) Fast Programming

During Fast Mode, the programming can be executed with two bus cycles operation. The Embedded Program Algorithm is executed by writing program set-up command (A0h) and data write cycles (PA/PD). (Refer to "(7) Embedded Programming Algorithm for Fast Mode" in ■FLOW CHART.)

(3) CFI (Common Flash Memory Interface)

The CFI (Common Flash Memory Interface) specification outlines device and host system software interrogation handshake which allows specific vendor-specified software algorithms to be used for entire families of devices. This allows device-independent, JEDEC ID-independent, and forward-and backward-compatible software support for the specified flash device families. Refer to CFI specification in detail.

The operation is initiated by writing the query command (98h) into the command register. Following the command write, a read cycle from specific address retrives device information. Please note that output data of upper byte (DQ_{15} to DQ_8) is “0” in word mode (16 bit) read. Refer to “Common Flash Memory Interface Code Table” in ■FLEXIBLE SECTOR-ERASE ARCHITECTURE. To terminate operation, it is necessary to write the read/reset command sequence into the register.

(4) Extended Sector Protect

In addition to normal sector protection, the MBM29LV160T/B has Extended Sector Protection as extended function. This function enable to protect sector by forcing V_{ID} on $\overline{RESET}$ pin and write a commnad sequence. Unlike conventional procedure, it is not necessary to force V_{ID} and control timing for control pins. The only $\overline{RESET}$ pin requires V_{ID} for sector protection in this mode. The extended sector protect requires V_{ID} on $\overline{RESET}$ pin. With this condition, the operation is initiated by writing the set-up command (60h) into the command register. Then, the sector addresses pins (A_{19}, A_{18}, A_{17}, A_{16}, A_{15}, A_{14}, A_{13} and A_{12}) and (A_6, A_1, A_0) = (0, 1, 0) should be set to the sector to be protected (recommend to set V_{IL} for the other addresses pins), and write extended sector protect command (60h). A sector is typically protected in 150 μs. To verify programming of the protection circuitry, the sector addresses pins (A_{19}, A_{18}, A_{17}, A_{16}, A_{15}, A_{14}, A_{13} and A_{12}) and (A_6, A_1, A_0) = (0, 1, 0) should be set and write a command (40h). Following the command write, a logical “1” at device output DQ_0 will produce for protected sector in the read operation. If the output data is logical “0”, please repeat to write extended sector protect command (60h) again. To terminate the operation, it is necessary to set $\overline{RESET}$ pin to V_{IH}.

Write Operation Status

Hardware Sequence Flags Table

Status			DQ_7	DQ_6	DQ_5	DQ_3	DQ_2
In Progress	Embedded Program Algorithm		$\overline{DQ_7}$	Toggle	0	0	1
	Embedded/Erase Algorithm		0	Toggle	0	1	Toggle
	Erase Suspend Mode	Erase Suspend Read (Erase Suspended Sector)	1	1	0	0	Toggle
		Erase Suspend Read (Non-Erase Suspended Sector)	Data	Data	Data	Data	Data
		Erase Suspend Program (Non-Erase Suspended Sector)	$\overline{DQ_7}$	Toggle*1	0	0	1*2
Exceeded Time Limits	Embedded Program Algorithm		$\overline{DQ_7}$	Toggle	1	0	1
	Embedded/Erase Algorithm		0	Toggle	1	1	N/A
	Erase Suspend Program (Non-Erase Suspended Sector)		$\overline{DQ_7}$	Toggle	1	0	N/A

*1 : Performing successive read operations from any address will cause DQ_6 to toggle.

*2 : Reading the byte address being programmed while in the erase-suspend program mode will indicate logic “1” at the DQ_2 bit. However, successive reads from the erase-suspended sector will cause DQ_2 to toggle.

Notes : • DQ_0 and DQ_1 are reserve pins for future use.
• DQ_4 is Fujitsu internal use only.

DQ_7

$\overline{Data}$ Polling

The MBM29LV160T/B device features $\overline{Data}$ Polling as a method to indicate to the host that the Embedded Algorithms are in progress or completed. During the Embedded Program Algorithm, an attempt to read the devices will produce the complement of the data last written to DQ_7. Upon completion of the Embedded Program Algorithm, an attempt to read the device will produce the true data last written to DQ_7. During the Embedded Erase Algorithm, an attempt to read the device will produce a "0" at the DQ_7 output. Upon completion of the Embedded Erase Algorithm an attempt to read the device will produce a "1" at the DQ_7 output. The flowchart for $\overline{Data}$ Polling (DQ_7) is shown in "(3) $\overline{Data}$ Polling Algorithm" in ■FLOW CHART.

For chip erase and sector erase, $\overline{Data}$ Polling is valid after the rising edge of the sixth $\overline{WE}$ pulse in the six-write pulse sequence. $\overline{Data}$ Polling must be performed at a sector address within any of the sectors being erased and not at a protected sector. Otherwise, the status may not be valid. Once the Embedded Algorithm operation is close to being completed, the MBM29LV160T/B data pins (DQ_7) may change asynchronously while the output enable ($\overline{OE}$) is asserted low. This means that the device is driving status information on DQ_7 at one instant of time and then that byte's valid data at the next instant of time. Depending on when the system samples the DQ_7 output, it may read the status or valid data. Even if the device has completed the Embedded Program Algorithm operation and DQ_7 has a valid data, the data outputs on DQ_6 to DQ_0 may be still invalid. The valid data on DQ_7 to DQ_0 will be read on successive read attempts.

The $\overline{Data}$ Polling feature is only active during the Embedded Programming Algorithm, Embedded Erase Algorithm or sector erase time-out.

See "(6) AC Waveforms for $\overline{Data}$ Polling during Embedded Algorithm Operations" in ■TIMING DIAGRAM for the $\overline{Data}$ Polling timing specifications and diagrams.

DQ_6

Toggle Bit I

The MBM29LV160T/B also feature the "Toggle Bit I" as a method to indicate to the host system that the Embedded Algorithms are in progress or completed.

During an Embedded Program or Erase Algorithm cycle, successive attempts to read ($\overline{OE}$ toggling) data from the device will result in DQ_6 toggling between one and zero. Once the Embedded Program or Erase Algorithm cycle is completed, DQ_6 will stop toggling and valid data can be read on the next successive attempts. During programming, the Toggle Bit I is valid after the rising edge of the fourth $\overline{WE}$ pulse in the four write pulse sequence. For chip erase and sector erase, the Toggle Bit I is valid after the rising edge of the sixth $\overline{WE}$ pulse in the six-write pulse sequence. The Toggle Bit I is active during the sector time out.

In programming, if the sector being written to is protected, the toggle bit will toggle for about 2 μs and then stop toggling without the data having changed. In erase, the device will erase all the selected sectors except for the ones that are protected. If all selected sectors are protected, the chip will toggle the Toggle Bit I for about 200 μs and then drop back into read mode, having changed none of the data.

Either $\overline{CE}$ or $\overline{OE}$ toggling will cause the DQ_6 to toggle. In addition, an Erase Suspend/Resume command will cause the DQ_6 to toggle.

See "(7) AC Waveforms for Toggle Bit I during Embedded Algorithm Operations" in ■TIMING DIAGRAM and "(4) Toggle Bit Algorithm" in ■FLOW CHART for the Toggle Bit I timing specifications and diagrams.

DQ_5

Exceeded Timing Limits

DQ_5 will indicate if the program or erase time has exceeded the specified limits (internal pulse count). Under these conditions DQ_5 will produce a "1". This is a failure condition which indicates that the program or erase cycle was not successfully completed. $\overline{Data}$ Polling is the only operating function of the device under this condition. The $\overline{CE}$ circuit will partially power down the device under these conditions. The $\overline{OE}$ and $\overline{WE}$ pins will control the output disable functions as described in "MBM29LV160T/B User Bus Operation Tables ($\overline{BYTE}$ = V_{IH} and $\overline{BYTE}$ = V_{IL})" (in ■DEVICE BUS OPERATION).

The DQ_5 failure condition may also appear if a user tries to program a non blank location without erasing. In this case the device locks out and never completes the Embedded Algorithm operation. Hence, the system never reads a valid data on DQ_7 and DQ_6 never stops toggling. Once the device has exceeded timing limits, the DQ_5 bit will indicate a "1." Please note that this is not a device failure condition since the device was incorrectly used. If this occurs, reset the device with command sequence.

DQ_3

Sector Erase Timer

After the completion of the initial sector erase command sequence the sector erase time-out will begin. DQ_3 will remain low until the time-out is complete. $\overline{\text{Data}}$ Polling and Toggle Bit I are valid after the initial sector erase command sequence.

If $\overline{\text{Data}}$ Polling or the Toggle Bit I indicates the device has been written with a valid erase command, DQ_3 may be used to determine if the sector erase timer window is still open. If DQ_3 is high ("1") the internally controlled erase cycle has begun; attempts to write subsequent commands to the device will be ignored until the erase operation is completed as indicated by $\overline{\text{Data}}$ Polling or Toggle Bit I. If DQ_3 is low ("0"), the device will accept additional sector erase commands. To insure the command has been accepted, the system software should check the status of DQ_3 prior to and following each subsequent sector erase command. If DQ_3 is high on the second status check, the command may not have been accepted.

See "Hardware Sequence Flags Table".

DQ_2

Toggle Bit II

This Toggle Bit II, along with DQ_6, can be used to determine whether the device is in the Embedded Erase Algorithm or in Erase Suspend.

Successive reads from the erasing sector will cause DQ_2 to toggle during the Embedded Erase Algorithm. If the device is in the erase-suspended-read mode, successive reads from the erase-suspended sector will cause DQ_2 to toggle. When the device is in the erase-suspended-program mode, successive reads from the byte address of the non-erase suspended sector will indicate a logic "1" at DQ_2.

DQ_6 is different from DQ_2 in that DQ_6 toggles only when the standard program or Erase, or Erase Suspend Program operation is in progress.

For example, DQ_2 and DQ_6 can be used together to determine if the erase-suspend-read mode is in progress. (DQ_2 toggles while DQ_6 does not.) See also "Toggle Bit Status Table" and "(16) DQ_2 vs. DQ_6" in ■TIMING DIAGRAM.

Furthermore, DQ_2 can also be used to determine which sector is being erased. When the device is in the erase mode, DQ_2 toggles if this bit is read from an erasing sector.

Toggle Bit Status Table

Mode	DQ_7	DQ_6	DQ_2
Program	$\overline{DQ_7}$	Toggle	1
Erase	0	Toggle	Toggle
Erase Suspend Read (Erase Suspended Sector)*1	1	1	Toggle
Erase-Suspend Program	$\overline{DQ_7}$	Toggle*1	1 *2

*1 : Performing successive read operations from any address will cause DQ_6 to toggle.

*2 : Reading the byte address being programmed while in the erase-suspend program mode will indicate logic "1" at the DQ_2 bit. However, successive reads from the erase-suspended sector will cause DQ_2 to toggle.

RY/$\overline{BY}$

Ready/Busy Pin

The MBM29LV160T/B provides a RY/$\overline{BY}$ open-drain output pin as a way to indicate to the host system that the Embedded Algorithms are either in progress or has been completed. If the output is low, the device is busy with either a program or erase operation. If the output is high, the device is ready to accept any read/write or erase operation. When the RY/$\overline{BY}$ pin is low, the devices will not accept any additional program or erase commands with the exception of the Erase Suspend command. If the MBM29LV160T/B is placed in an Erase Suspend mode, the RY/$\overline{BY}$ output will be high, by means of connecting with a pull-up resister to V_{CC}.

During programming, the RY/$\overline{BY}$ pin is driven low after the rising edge of the fourth $\overline{WE}$ pulse. During an erase operation, the RY/$\overline{BY}$ pin is driven low after the rising edge of the sixth $\overline{WE}$ pulse. The RY/$\overline{BY}$ pin will indicate a busy condition during the $\overline{RESET}$ pulse. See “(8) RY/$\overline{BY}$ Timing Diagram during Program/Erase Operations” and “(9) $\overline{RESET}$, RY/$\overline{BY}$ Timing Diagram” in ■TIMING DIAGRAM for a detailed timing diagram. The RY/$\overline{BY}$ pin is pulled high in standby mode.

Since this is an open-drain output, the pull-up resistor needs to be connected to V_{CC}; multiples of devices may be connected to the host system via more than one RY/$\overline{BY}$ pin in parallel.

RESET

Hardware Reset Pin

The MBM29LV160T/B device may be reset by driving the $\overline{RESET}$ pin to V_{IL}. The $\overline{RESET}$ pin has a pulse requirement and has to be kept low (V_{IL}) for at least 500 ns in order to properly reset the internal state machine. Any operation in the process of being executed will be terminated and the internal state machine will be reset to the read mode t_{READY} after the $\overline{RESET}$ pin is driven low. Furthermore, once the $\overline{RESET}$ pin goes high, the device requires an additional t_{RH} before it allows read access. When the $\overline{RESET}$ pin is low, the device will be in the standby mode for the duration of the pulse and all the data output pins will be tri-stated. If a hardware reset occurs during a program or erase operation, the data at that particular location will be corrupted. Please note that the RY/$\overline{BY}$ output signal should be ignored during the $\overline{RESET}$ pulse. Refer to “(9) $\overline{RESET}$, RY/$\overline{BY}$ Timing Diagram” in ■TIMING DIAGRAM for the timing diagram. Refer to Temporary Sector Unprotection for additional functionality.

If hardware reset occurs during Embedded Erase Algorithm, there is a possibility that the erasing sector(s) will need to be erased again before they can be programmed.

Word/Byte Configuration

The $\overline{BYTE}$ pin selects the byte (8-bit) mode or word (16-bit) mode for the MBM29LV160T/B device. When this pin is driven high, the device operates in the word (16-bit) mode. The data is read and programmed at DQ_{15} to DQ_0. When this pin is driven low, the device operates in byte (8-bit) mode. Under this mode, DQ_{15}/A_{-1} pin becomes the lowest address bit and DQ_{14} to DQ_8 bits are tri-stated. However, the command bus cycle is always an 8-bit operation and hence commands are written at DQ_7 to DQ_0 and DQ_{15} to DQ_8 bits are ignored. Refer to “(10) Timing Diagram for Word Mode Configuration” and “(11) Timing Diagram for Byte Mode Configuration” in ■TIMING DIAGRAM for the timing diagrams.

Data Protection

The MBM29LV160T/B is designed to offer protection against accidental erasure or programming caused by spurious system level signals that may exist during power transitions. During power up the device automatically resets the internal state machine to the Read mode. Also, with its control register architecture, alteration of the memory contents only occurs after successful completion of specific multi-bus cycle command sequence.

The device also incorporates several features to prevent inadvertent write cycles resulting form V_{CC} power-up and power-down transitions or system noise.

Low V_{CC} Write Inhibit

To avoid initiation of a write cycle during V_{CC} power-up and power-down, a write cycle is locked out for V_{CC} less than 2.3 V (typically 2.4 V). If $V_{CC} < V_{LKO}$, the command register is disabled and all internal program/erase circuits are disabled. Under this condition, the device will reset to the read mode. Subsequent writes will be ignored until

the V_{CC} level is greater than V_{LKO}. It is the users responsibility to ensure that the control pins are logically correct to prevent unintentional writes when V_{CC} is above 2.3 V.

If the Embedded Erase Algorithm is interrupted, there is possibility that the erasing sector(s) will need to be erased again prior to programming.

Write Pulse “Glitch” Protection

Noise pulses of less than 3 ns (typical) on $\overline{OE}$, $\overline{CE}$, or $\overline{WE}$ will not change the command registers.

Logical Inhibit

Writing is inhibited by holding any one of $\overline{OE} = V_{IL}$, $\overline{CE} = V_{IH}$, or $\overline{WE} = V_{IH}$. To initiate a write, $\overline{CE}$ and $\overline{WE}$ must be a logical zero while $\overline{OE}$ is a logical one.

Power-up Write Inhibit

Power-up of the devices with $\overline{WE} = \overline{CE} = V_{IL}$ and $\overline{OE} = V_{IH}$ will not accept commands on the rising edge of $\overline{WE}$. The internal state machine is automatically reset to read mode on power-up.

Sector Protection

Device user is able to protect each sector individually to store and protect data. Protection circuit voids both program and erase commands that are addressed to protect sectors.

Any command to program or erase addressed to protected sector are ignored (see “Sector Protection” in ■FUNCTIONAL DESCRIPTION).

■ ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Rating		Unit
		Min	Max	
Storage Temperature	Tstg	−55	+125	°C
Ambient Temperature with Power Applied	T_A	−40	+85	°C
Voltage with Respect to Ground All pins except A_9, $\overline{OE}$, $\overline{RESET}$*1, *2	V_{IN}, V_{OUT}	−0.5	V_{CC}+0.5	V
A_9, $\overline{OE}$ and $\overline{RESET}$*1, *3	V_{IN}	−2.0	+13.0	V
Power Supply Voltage*1	V_{CC}	−0.5	+5.5	V

*1: Voltage is defined on the basis of V_{SS} = GND = 0 V.

*2: Minimum DC voltage on input or I/O pins is –0.5 V. During voltage transitions, input or I/O pins may undershoot V_{SS} to –2.0 V for periods of up to 20 ns. Maximum DC voltage on input or I/O pins is V_{CC} +0.5 V. During voltage transitions, input or I/O pins may overshoot to V_{CC} +2.0 V for periods of up to 20 ns.

*3: Minimum DC input voltage on A_9, $\overline{OE}$, and $\overline{RESET}$ pins is –0.5 V. During voltage transitions, A_9, $\overline{OE}$, and $\overline{RESET}$ pins may undershoot V_{SS} to –2.0 V for periods of up to 20 ns. Voltage difference between input and supply voltage (V_{IN} – V_{CC}) does not exceed +9.0 V. Maximum DC input voltage on A_9, $\overline{OE}$, and $\overline{RESET}$ pins are +13.0 V which may overshoot to +14.0 V for periods of up to 20 ns.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

■ RECOMMENDED OPERATING CONDITIONS

Parameter	Symbol	Part number	Value		Unit
			Min	Max	
Ambient Temperature	T_A	MBM29LV160T/B-80	−20	+70	°C
		MBM29LV160T/B-90/-12	−40	+85	°C
Power Supply Voltage*	V_{CC}	MBM29LV160T/B-80	+3.0	+3.6	V
		MBM29LV160T/B-90/-12	+2.7		

* : Voltage is defined on the basis of V_{SS} = GND = 0 V.

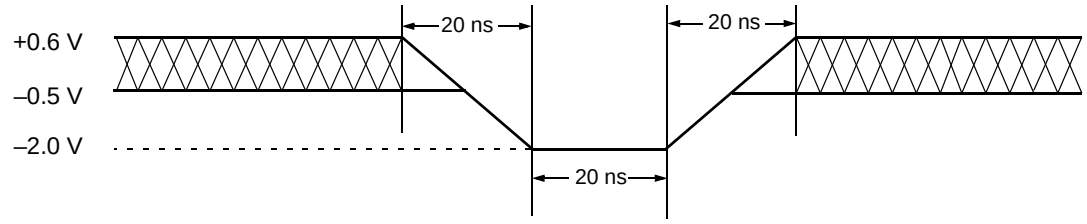
Note : Operating ranges define those limits between which the functionality of the devices are guaranteed.

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

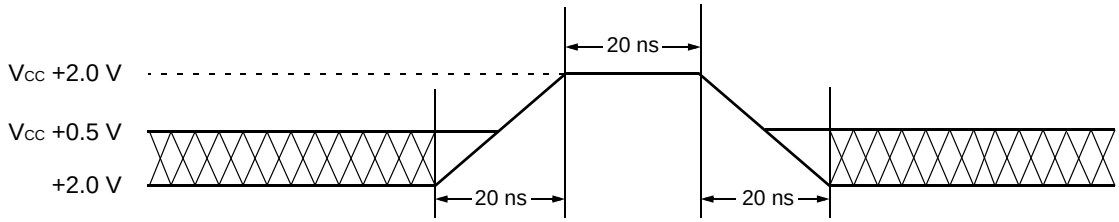
Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

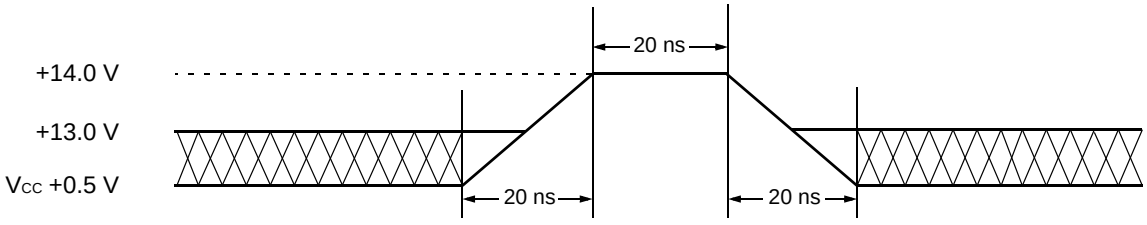
■ MAXIMUM OVERSHOOT/MAXIMUM UNDERSHOOT



Maximum Undershoot Waveform



Maximum Overshoot Waveform 1



Note : This waveform is applied for A_9, $\overline{OE}$, and $\overline{RESET}$.

Maximum Overshoot Waveform 2

■ DC CHARACTERISTICS

Parameter	Symbol	Test Conditions		Min	Max	Unit
Input Leakage Current	I_{LI}	V_{IN} = V_{SS} to V_{CC}, V_{CC} = V_{CC} Max		–1.0	+1.0	µA
Output Leakage Current	I_{LO}	V_{OUT} = V_{SS} to V_{CC}, V_{CC} = V_{CC} Max		–1.0	+1.0	µA
A_9, $\overline{OE}$, $\overline{RESET}$ Inputs Leakage Current	I_{LIT}	V_{CC} = V_{CC} Max, A_9, $\overline{OE}$, $\overline{RESET}$ = 12.5 V		—	35	µA
V_{CC} Active Current *1	I_{CC1}	$\overline{CE}$ = V_{IL}, $\overline{OE}$ = V_{IH}, f = 10 MHz	Byte	—	30	mA
			Word		35	
		$\overline{CE}$ = V_{IL}, $\overline{OE}$ = V_{IH}, f = 5 MHz	Byte	—	15	mA
			Word		17	
V_{CC} Active Current *2	I_{CC2}	$\overline{CE}$ = V_{IL}, $\overline{OE}$ = V_{IH}		—	35	mA
V_{CC} Current (Standby)	I_{CC3}	V_{CC} = V_{CC} Max, $\overline{CE}$ = V_{CC} ±0.3 V, $\overline{RESET}$ = V_{CC} ±0.3 V		—	5	µA
V_{CC} Current (Standby, $\overline{RESET}$)	I_{CC4}	V_{CC} = V_{CC} Max, $\overline{RESET}$ = V_{SS} ±0.3 V		—	5	µA
V_{CC} Current (Automatic Sleep Mode) *3	I_{CC5}	V_{CC} = V_{CC} Max, $\overline{CE}$ = V_{SS} ±0.3 V, $\overline{RESET}$ = V_{CC} ±0.3 V, V_{IN} = V_{CC} ±0.3 V or V_{SS} ±0.3 V		—	5	µA
Input Low Voltage	V_{IL}	—		–0.5	0.6	V
Input High Voltage	V_{IH}	—		2.0	V_{CC} + 0.3	V
Voltage for Autoselect,Sector Protection, and Temporary Sector Unprotection (A_9, $\overline{OE}$, $\overline{RESET}$) *4, *5	V_{ID}	—		11.5	12.5	V
Output Low Voltage	V_{OL}	I_{OL} = 4.0 mA, V_{CC} = V_{CC} Min		—	0.45	V
Output High Voltage	V_{OH1}	I_{OH} = –2.0 mA, V_{CC} = V_{CC} Min		2.4	—	V
	V_{OH2}	I_{OH} = –100 µA		V_{CC} – 0.4	—	V
Low V_{CC} Lock-Out Voltage	V_{LKO}	—		2.3	2.5	V

*1 : The I_{CC} current listed includes both the DC operating current and the frequency dependent component.

*2 : I_{CC} active while Embedded Erase or Embedded Program is in progress.

*3 : Automatic sleep mode enables the low power mode when address remain stable for 150 ns.

*4 : The timing is only for Sector Protection operation and Autoselect mode.

*5 : (V_{ID} – V_{CC}) do not exceed 9 V.

■ AC CHARACTERISTICS

- **Read Only Operations Characteristics**

Parameter	Symbol		Test Setup	-80*		-90*		-12*		Unit
	JEDEC	Standard		Min	Max	Min	Max	Min	Max	
Read Cycle Time	t_{AVAV}	t_{RC}	—	80	—	90	—	120	—	ns
Address to Output Delay	t_{AVQV}	t_{ACC}	$\overline{CE}$ = V_{IL} $\overline{OE}$ = V_{IL}	—	80	—	90	—	120	ns
Chip Enable to Output Delay	t_{ELQV}	t_{CE}	$\overline{OE}$ = V_{IL}	—	80	—	90	—	120	ns

*1 : This does not include the preprogramming time.

*2 : This timing is for Sector Protection operation.

■ ERASE AND PROGRAMMING PERFORMANCE

Parameter	Limits			Unit	Comments
	Min	Typ	Max		
Sector Erase Time	—	1	10	s	Excludes programming time prior to erasure
Byte Programming Time	—	8	360	µs	Excludes system-level overhead
Word Programming Time	—	16	300		
Chip Programming Time	—	16.8	50	s	Excludes system-level overhead
Erase/Program Cycle	100,000	—	—	cycle	—

■ TSOP (1) PIN CAPACITANCE

($f = 1.0$ MHz, $T_A = +25$ °C)

Parameter	Symbol	Test Setup	Typ	Max	Unit
Input Capacitance	C_{IN}	$V_{IN} = 0$	7.5	9.5	pF
Output Capacitance	C_{OUT}	$V_{OUT} = 0$	8	10	pF
Control Pin Capacitance	C_{IN2}	$V_{IN} = 0$	10	13	pF

Note : DQ_{15}/A_{-1} pin capacitance is stipulated by output capacitance.

■ CSOP PIN CAPACITANCE

($f = 1.0$ MHz, $T_A = +25$ °C)

Parameter	Symbol	Test Setup	Typ	Max	Unit
Input Capacitance	C_{IN}	$V_{IN} = 0$	7.5	9.5	pF
Output Capacitance	C_{OUT}	$V_{OUT} = 0$	8	10	pF
Control Pin Capacitance	C_{IN2}	$V_{IN} = 0$	10	13	pF

Note : DQ_{15}/A_{-1} pin capacitance is stipulated by output capacitance.

■ FBGA PIN CAPACITANCE

($f = 1.0$ MHz, $T_A = +25$ °C)

Parameter	Symbol	Test Setup	Typ	Max	Unit
Input Capacitance	C_{IN}	$V_{IN} = 0$	7.5	9.5	pF
Output Capacitance	C_{OUT}	$V_{OUT} = 0$	8	10	pF
Control Pin Capacitance	C_{IN2}	$V_{IN} = 0$	10	13	pF

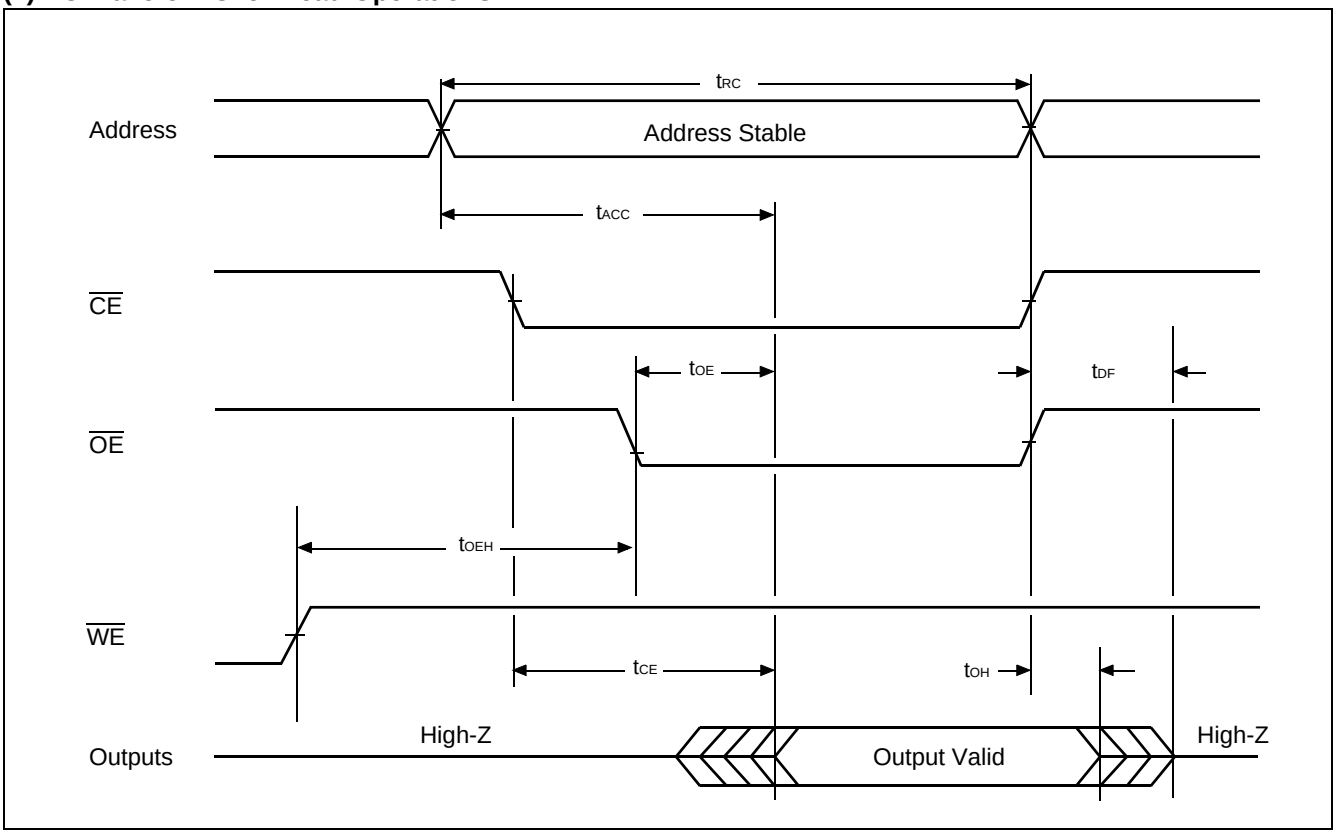
Note : DQ_{15}/A_{-1} pin capacitance is stipulated by output capacitance.

■ TIMING DIAGRAM

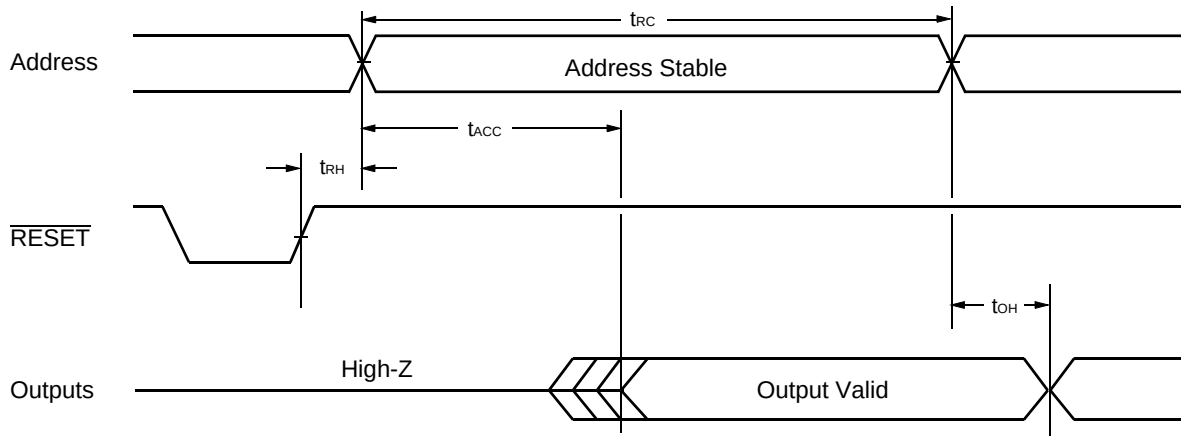
- **Key to Switching Waveforms**

WAVEFORM	INPUTS	OUTPUTS
	Must Be Steady	Will Be Steady
	May Change from H to L	Will Be Change from H to L
	May Change from L to H	Will Be Change from L to H
	"H" or "L": Any Change Permitted	Changing, State Unknown
	Does Not Apply	Center Line is High-Impedance "Off" State

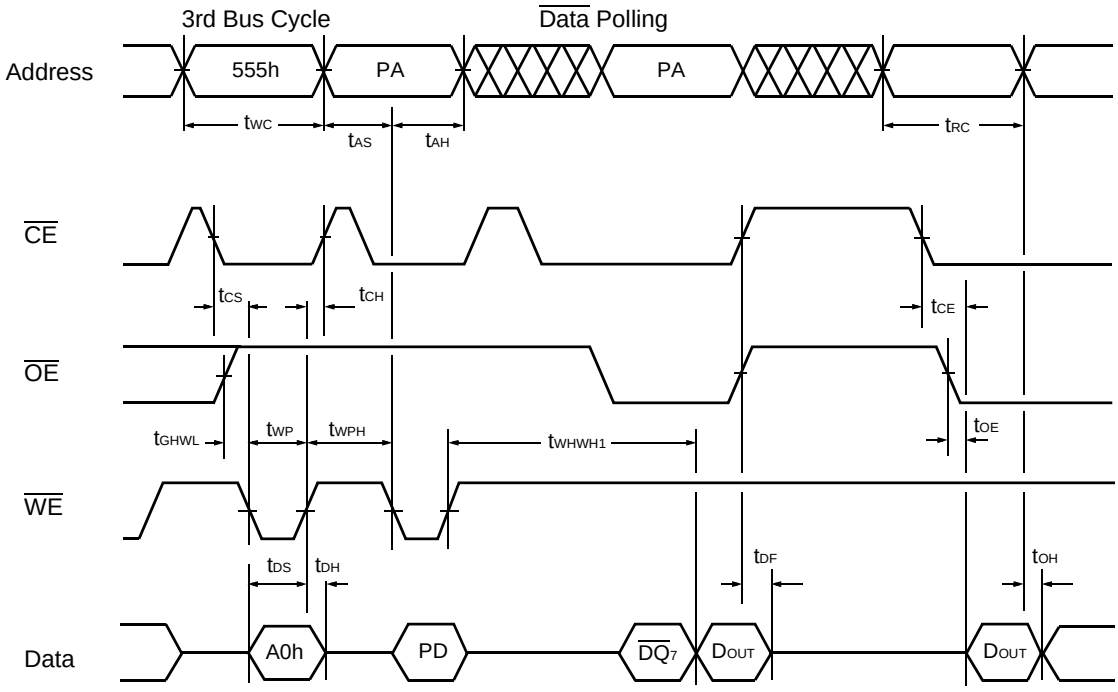
(1) AC Waveforms for Read Operations



(2) AC Waveforms for Hardware Reset/Read Operations

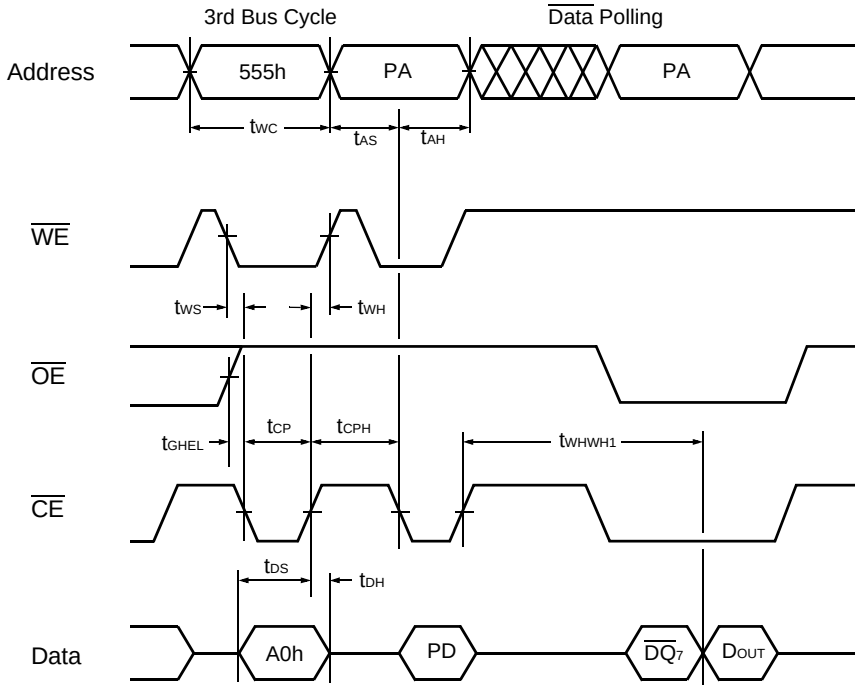


(3) AC Waveforms for Alternate $\overline{WE}$ Controlled Program Operations



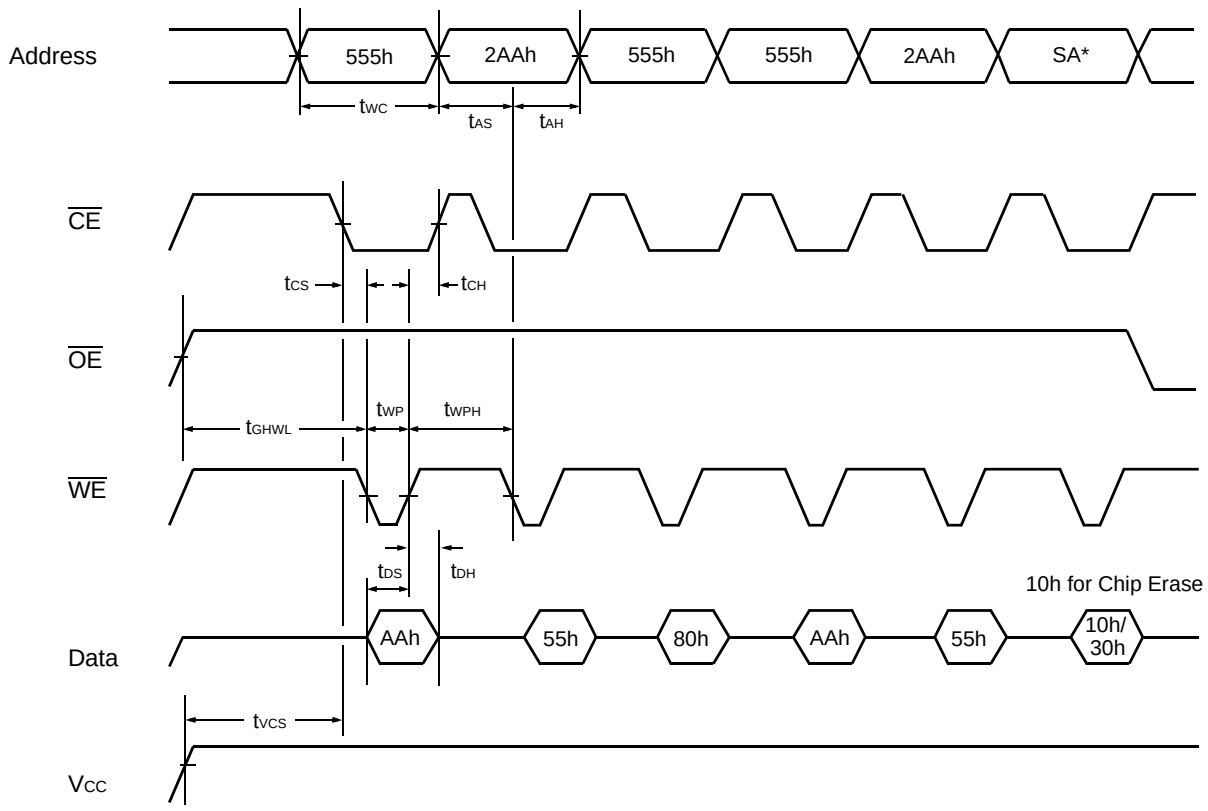
Notes : • PA is address of the memory location to be programmed.
- PD is data to be programmed at word address.
- $\overline{DQ_7}$ is the output of the complement of the data written to the device.
- D_{OUT} is the output of the data written to the device.
- Figure indicates last two bus cycles out of four bus cycle sequence.
- These waveforms are for the ×16 mode. (The addresses differ from ×8 mode.)

(4) AC Waveforms for Alternate $\overline{CE}$ Controlled Program Operations



Notes :
- PA is address of the memory location to be programmed.
- PD is data to be programmed at word address.
- $\overline{DQ_7}$ is the output of the complement of the data written to the device.
- D_{OUT} is the output of the data written to the device.
- Figure indicates last two bus cycles out of four bus cycle sequence.
- These waveforms are for the ×16 mode. (The addresses differ from ×8 mode.)

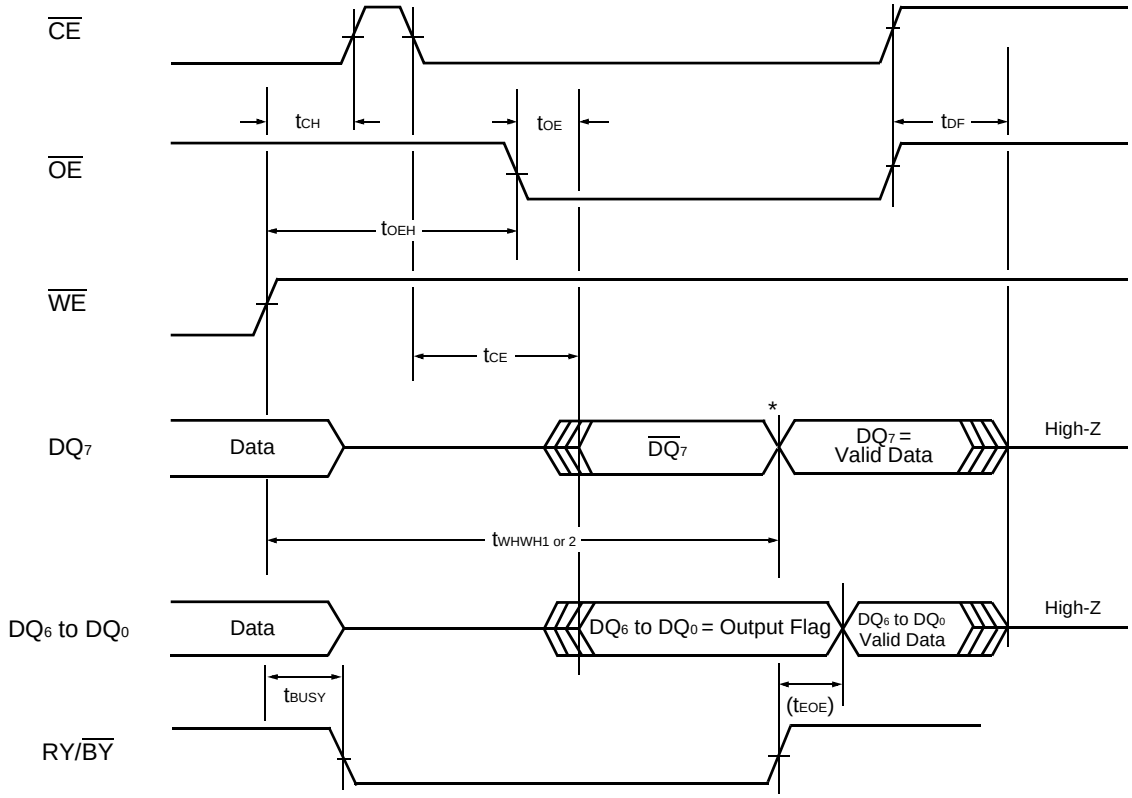
(5) AC Waveforms for Chip/Sector Erase Operations



* : SA is the sector address for Sector Erase. Addresses = 555h (Word), AAAAh (Byte) for Chip Erase.

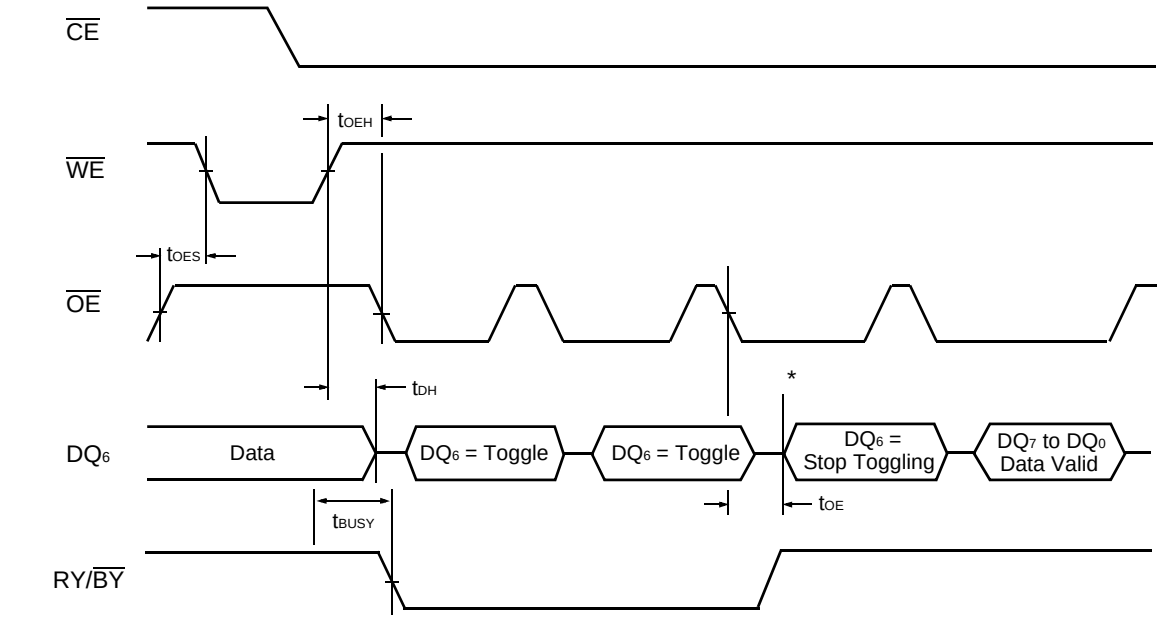
Note: These waveforms are for the ×16 mode. (The addresses differ from ×8 mode.)

(6) AC Waveforms for $\overline{\text{Data}}$ Polling during Embedded Algorithm Operations



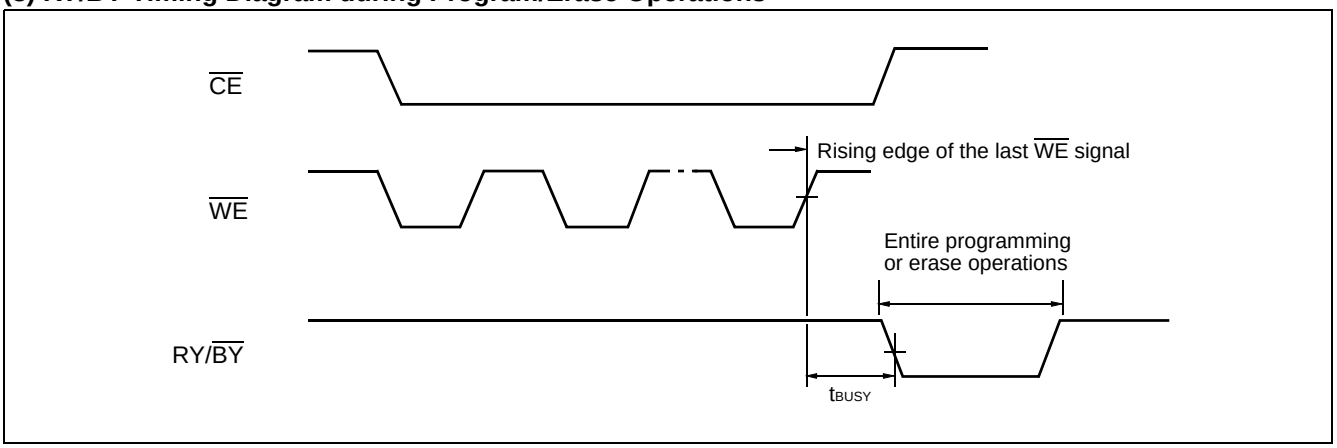
* : DQ_7 = Valid Data (The device has completed the Embedded operation.)

(7) AC Waveforms for Toggle Bit I during Embedded Algorithm Operations

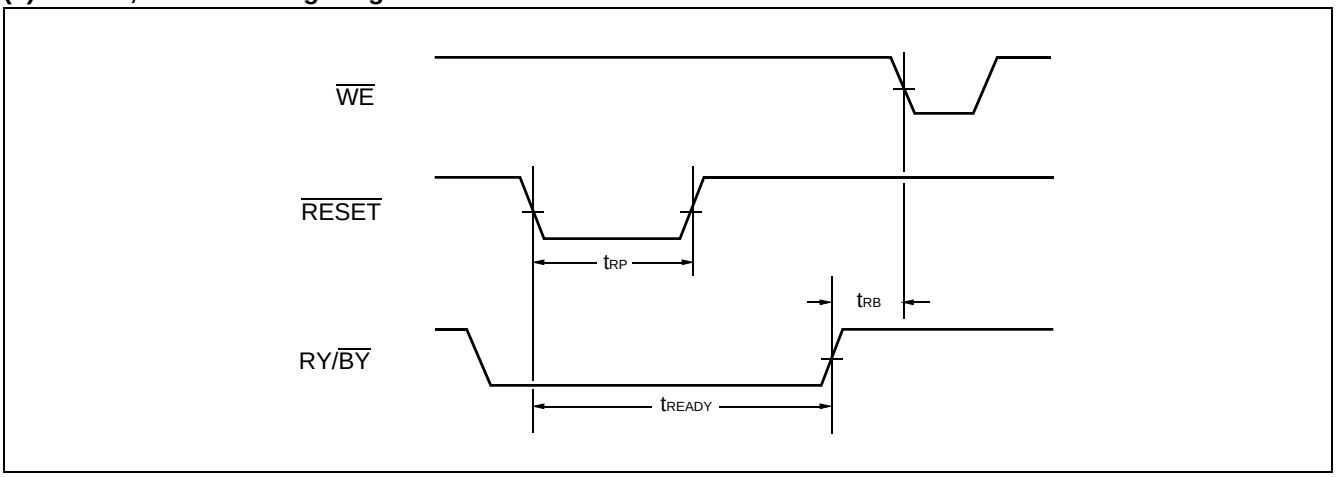


* : DQ_6 = Stops toggling. (The device has completed the Embedded operation.)

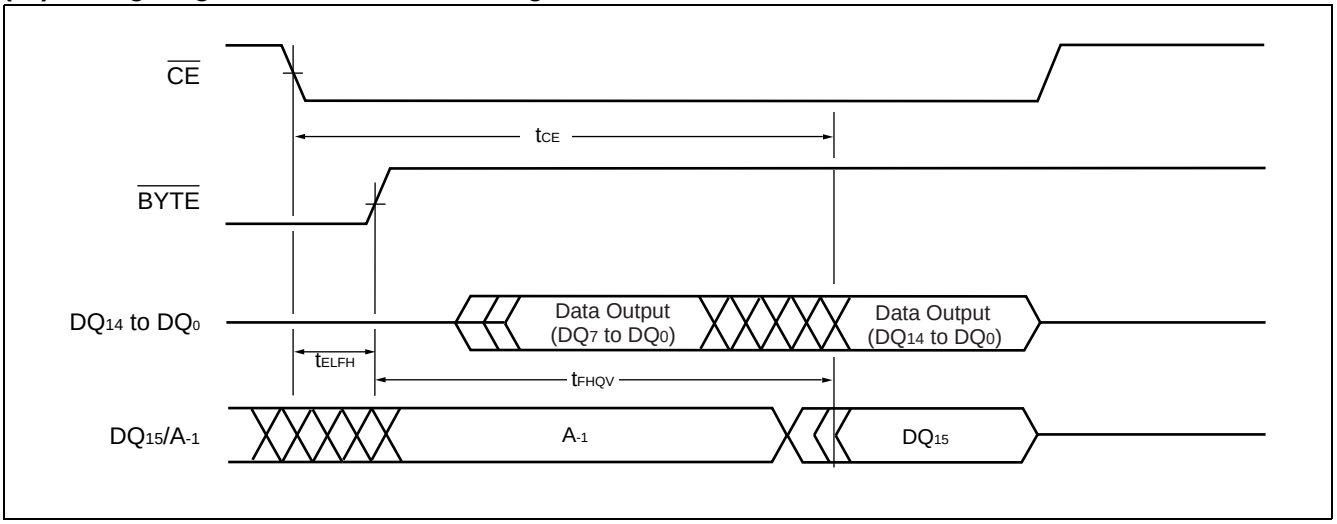
(8) RY/$\overline{BY}$ Timing Diagram during Program/Erase Operations



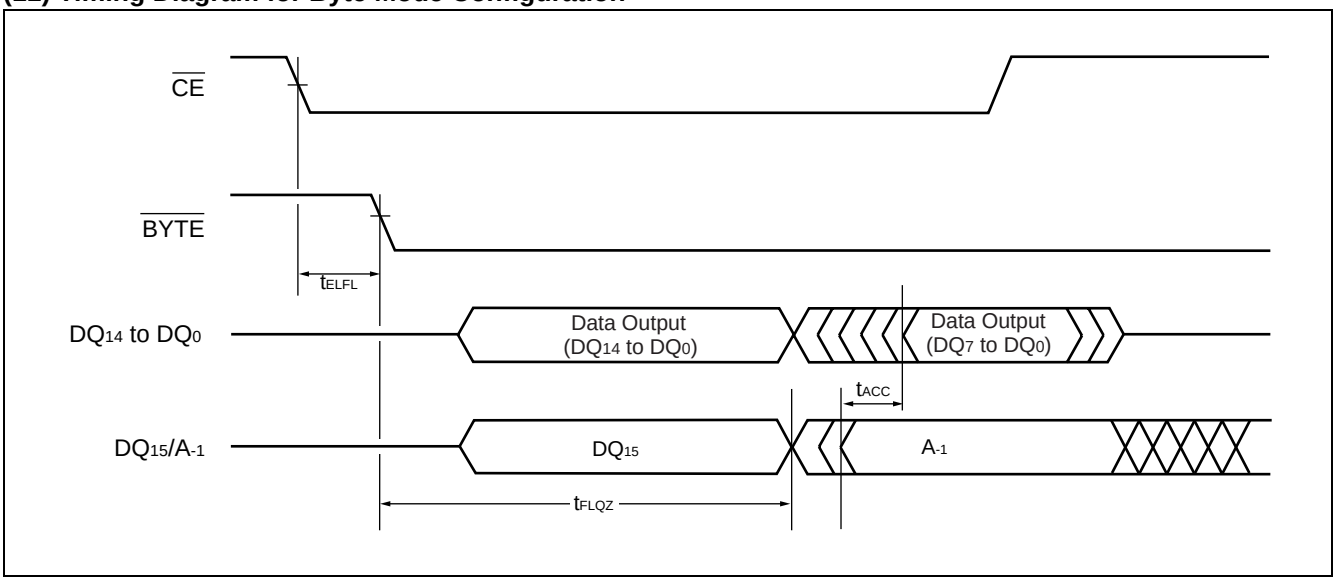
(9) $\overline{RESET}$, RY/$\overline{BY}$ Timing Diagram



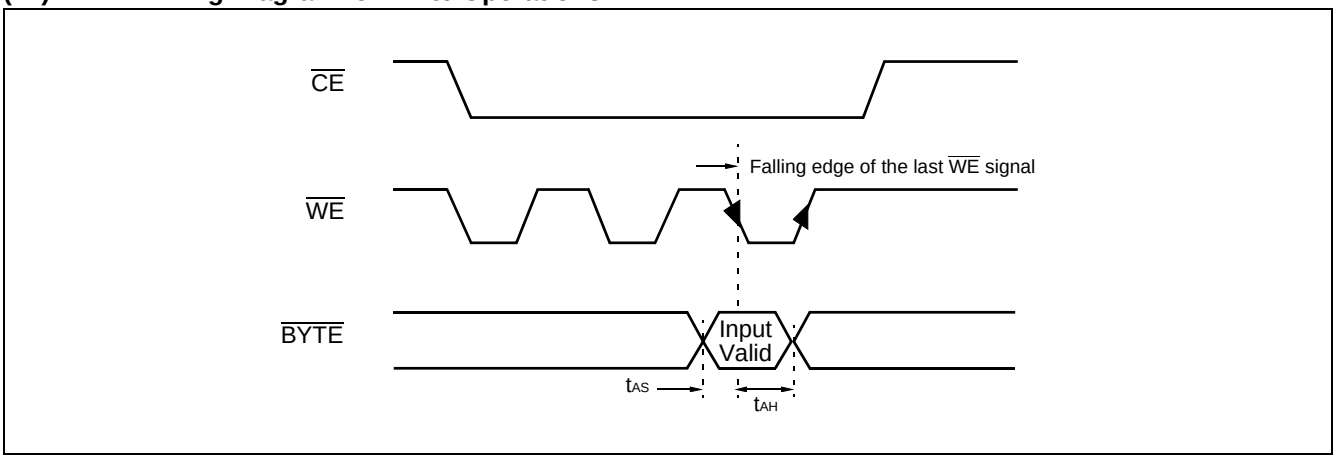
(10) Timing Diagram for Word Mode Configuration



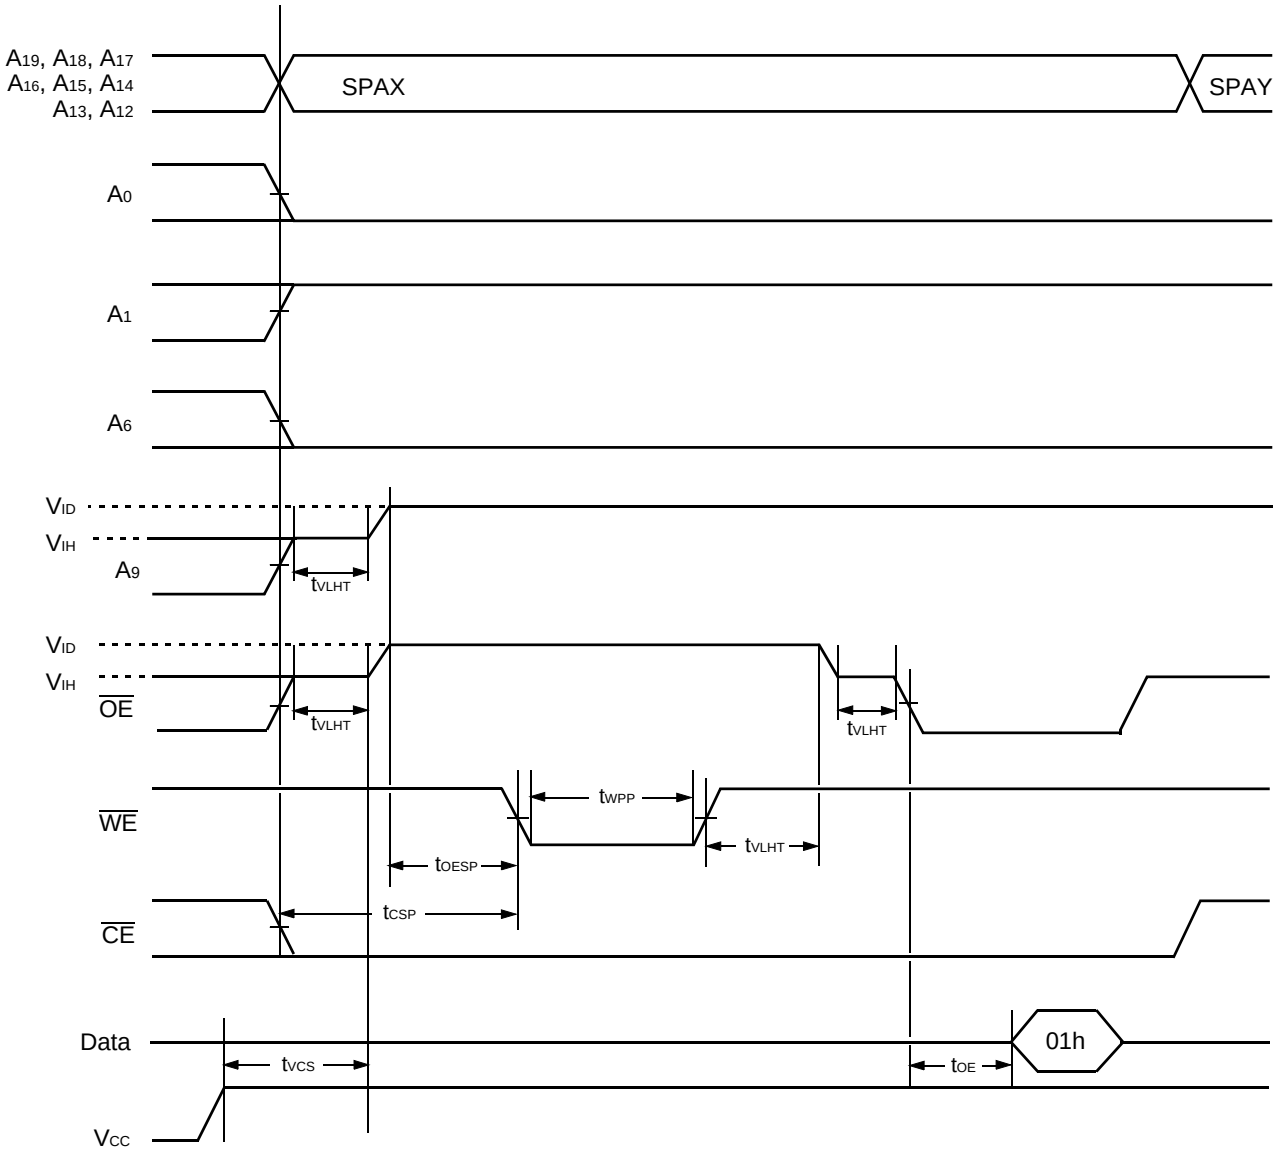
(11) Timing Diagram for Byte Mode Configuration



(12) $\overline{\text{BYTE}}$ Timing Diagram for Write Operations



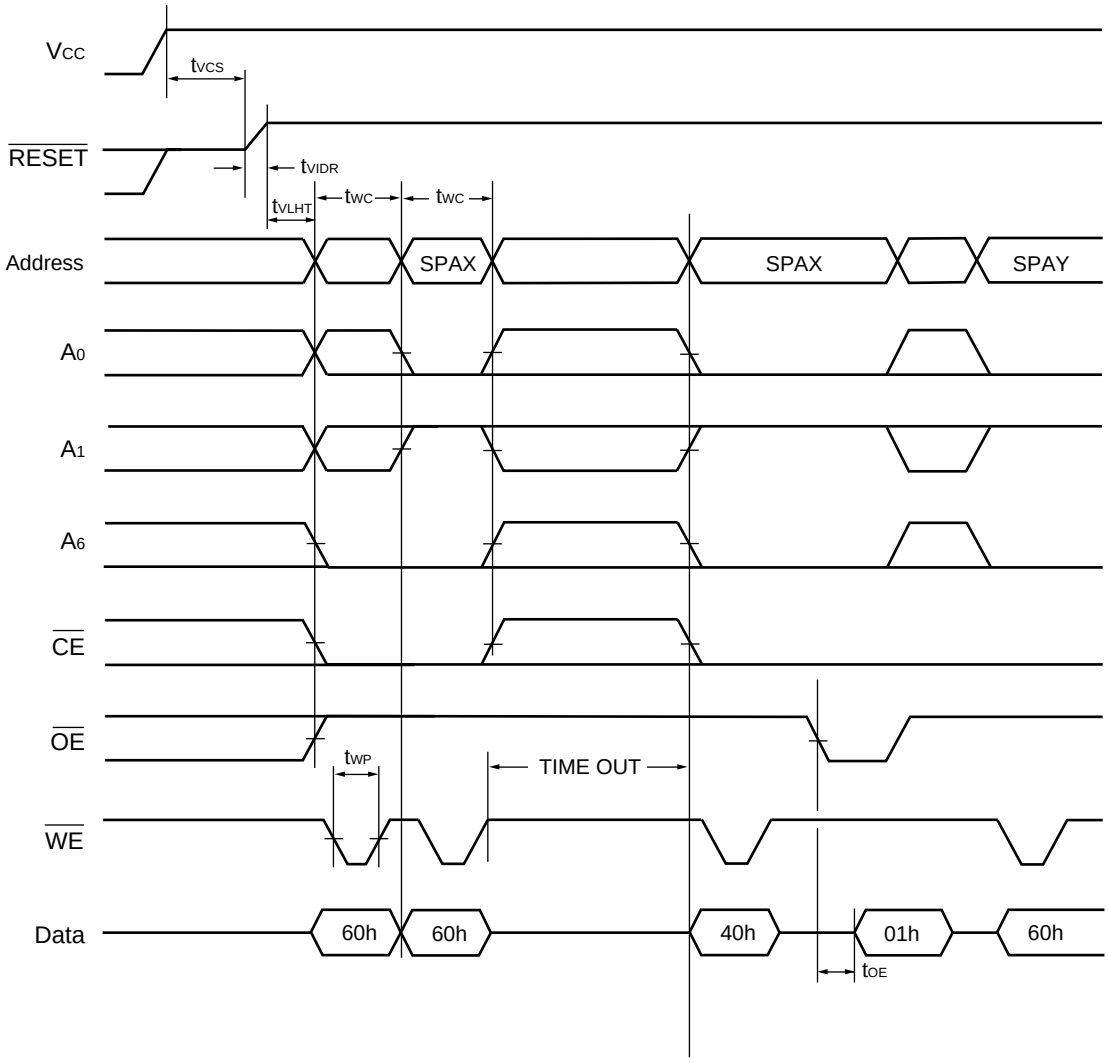
(13) AC Waveforms for Sector Protection Timing Diagram



SPAX = Sector Address for initial sector
SPAY = Sector Address for next sector

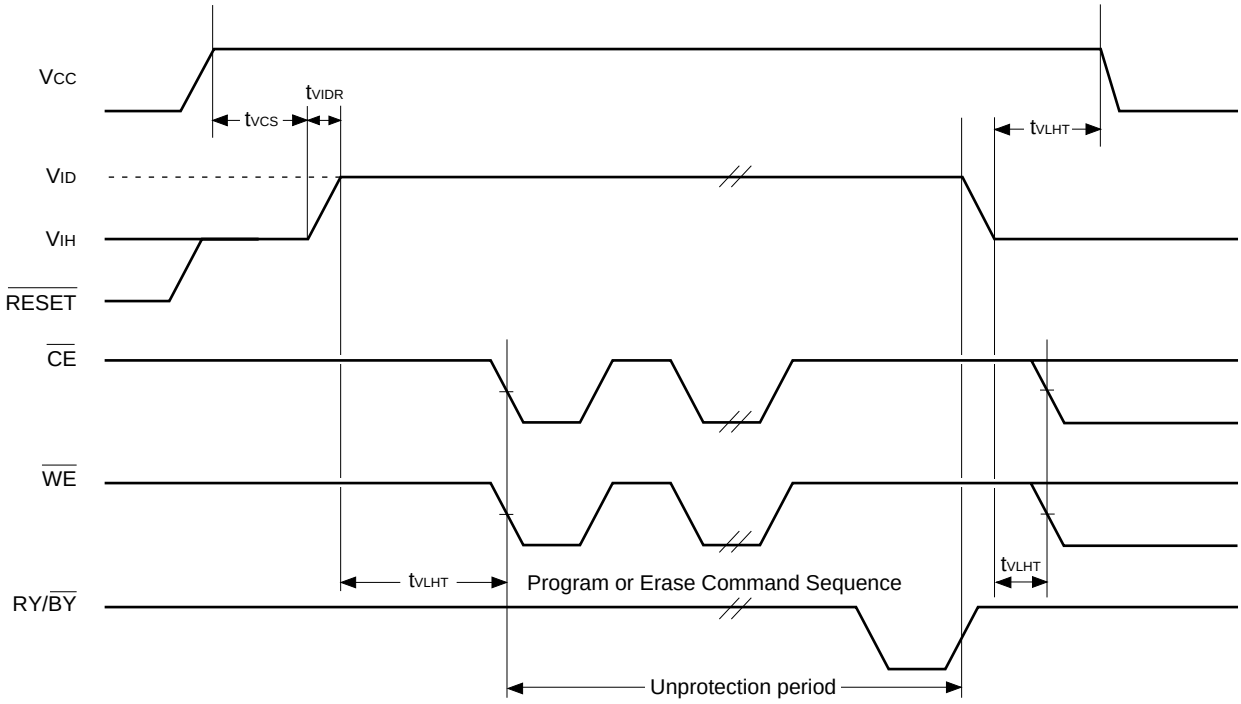
Note : A_{-1} is V_{IL} on byte mode.

(14) Extended Sector Protection Timing Diagram

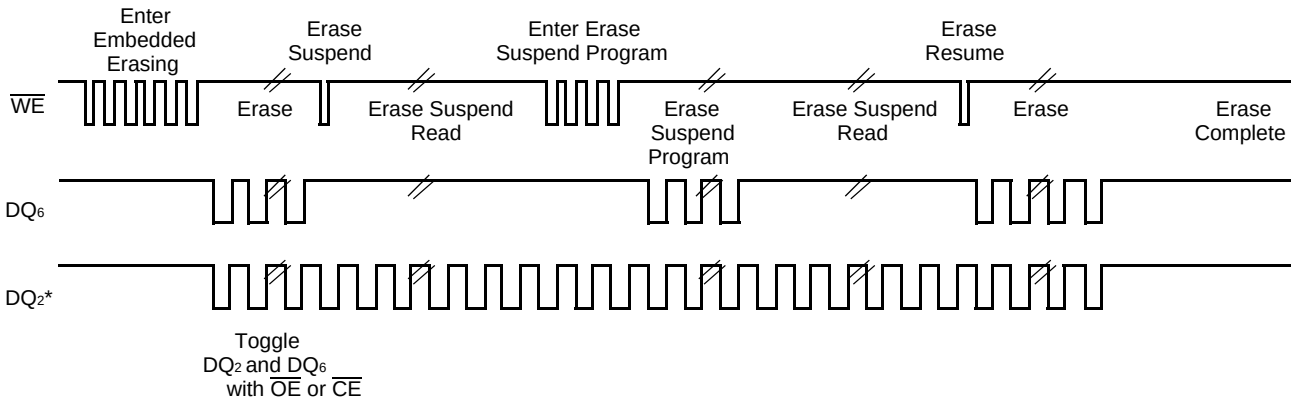


SPAX : Sector Address to be protected
SPAY : Next Sector Address to be protected
TIME-OUT : Time-out Window = 150 μs (Min)

(15) Temporary Sector Unprotection Timing Diagram



(16) DQ_2 vs. DQ_6

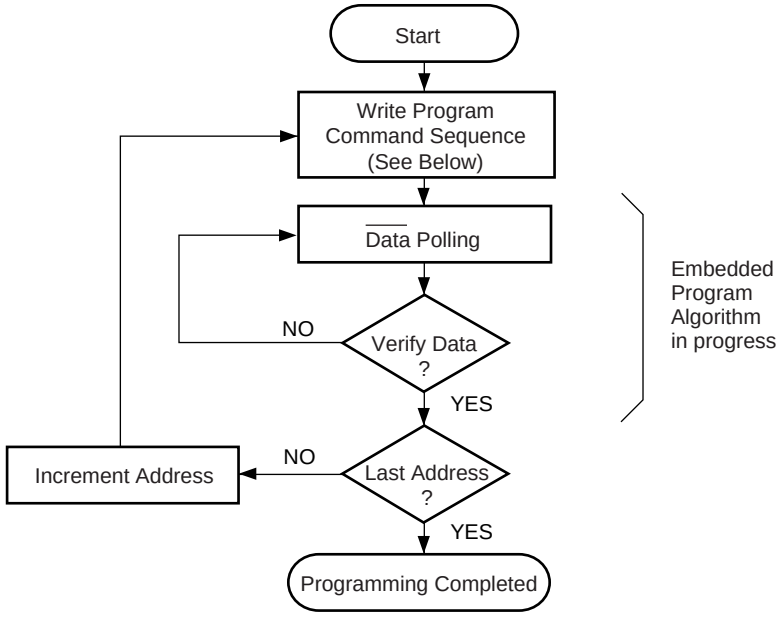


* : DQ_2 is read from the erase-suspended sector.

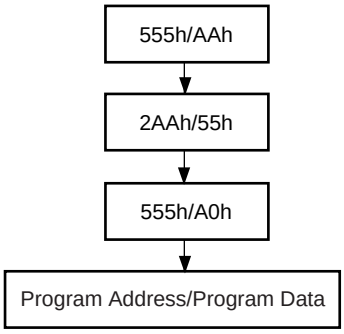
■ FLOW CHART

(1) Embedded Program™ Algorithm

EMBEDDED ALGORITHM



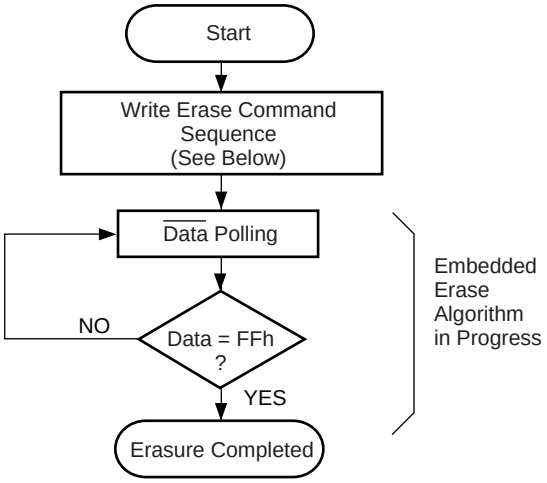
Program Command Sequence (Address/Command) :



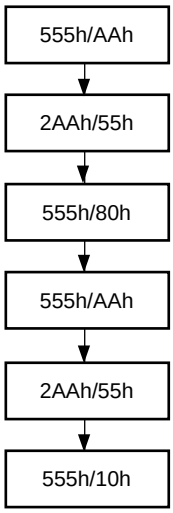
Notes : • The sequence is applied for ×16 mode.
• The addresses differ from ×8 mode.

(2) Embedded Erase™ Algorithm

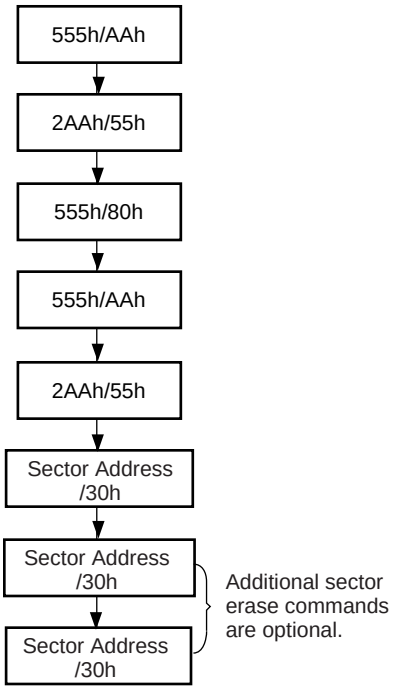
EMBEDDED ALGORITHM



Chip Erase Command Sequence (Addresss/Command) :



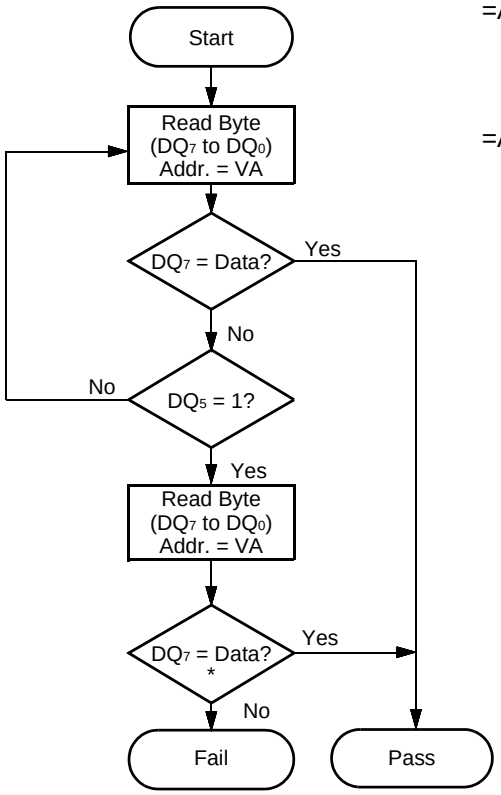
Individual Sector/Multiple Sector Erase Command Sequence (Address/Command) :



Note : The sequence is applied for ×16 mode.
The addresses differ from ×8 mode.

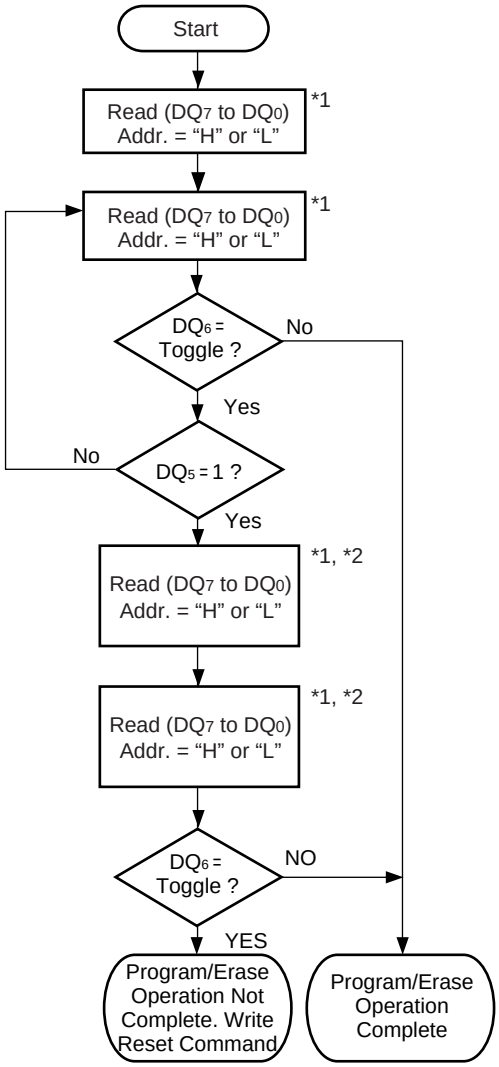
(3) $\overline{\text{Data}}$ Polling Algorithm

VA =Address for programming
=Any of the sector addresses within the sector being erased during sector erase or multiple sector erases operation.
=Any of the sector addresses within the sector not being protected during chip erases operation.



* : DQ_7 is rechecked even if DQ_5 = “1” because DQ_7 may change simultaneously with DQ_5.

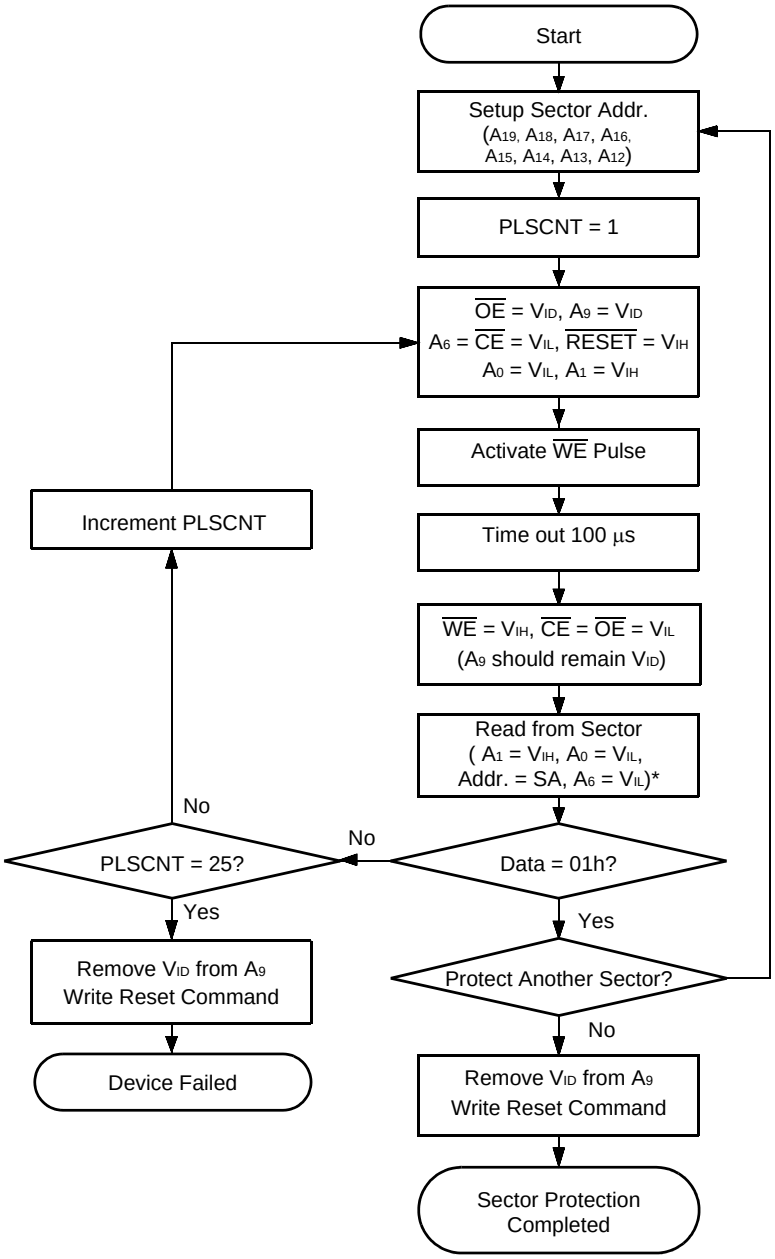
(4) Toggle Bit Algorithm



*1 : Read toggle bit twice to determine whether it is toggling.

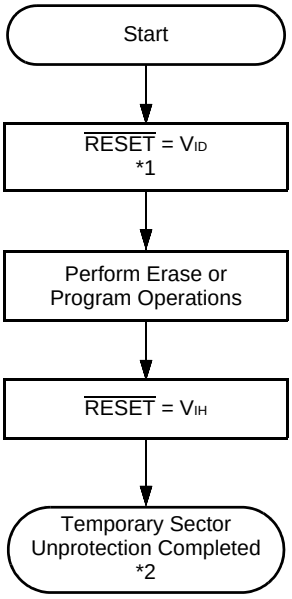
*2 : Recheck toggle bit because it may stop toggling as DQ_5 changes to "1".

(5) Sector Protection Algorithm



* : A_{-1} is V_{IL} on byte mode.

(6) Temporary Sector Unprotection Algorithm

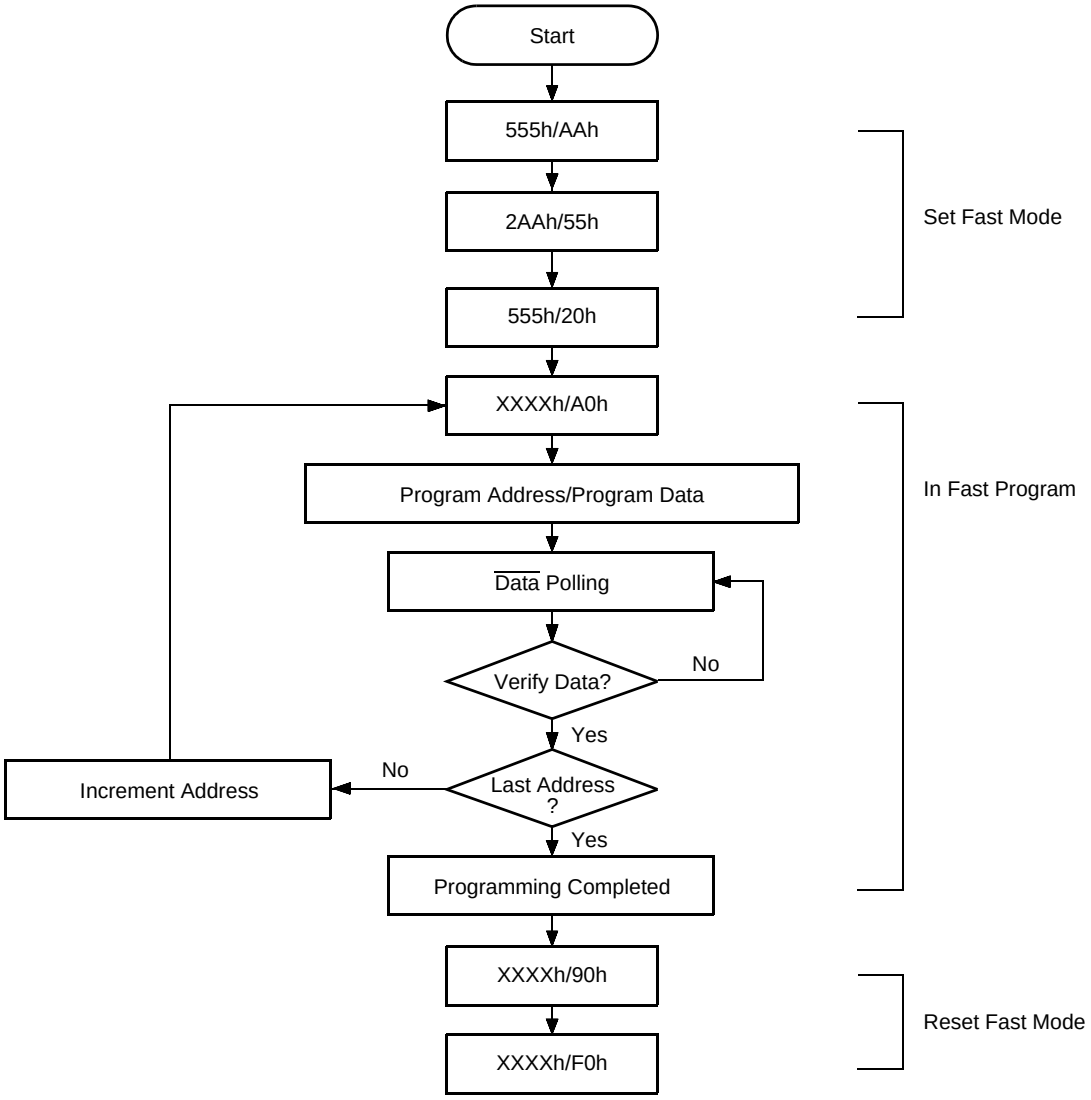


*1 : All protected sectors are unprotected.

*2 : All previously protected sectors are protected once again.

(7) Embedded Programming Algorithm for Fast Mode

FAST MODE ALGORITHM



Notes : • The sequence is applied for ×16 mode.
• The addresses differ from ×8 mode.

(8) Extended Sector Protect Algorithm

FAST MODE ALGORITHM

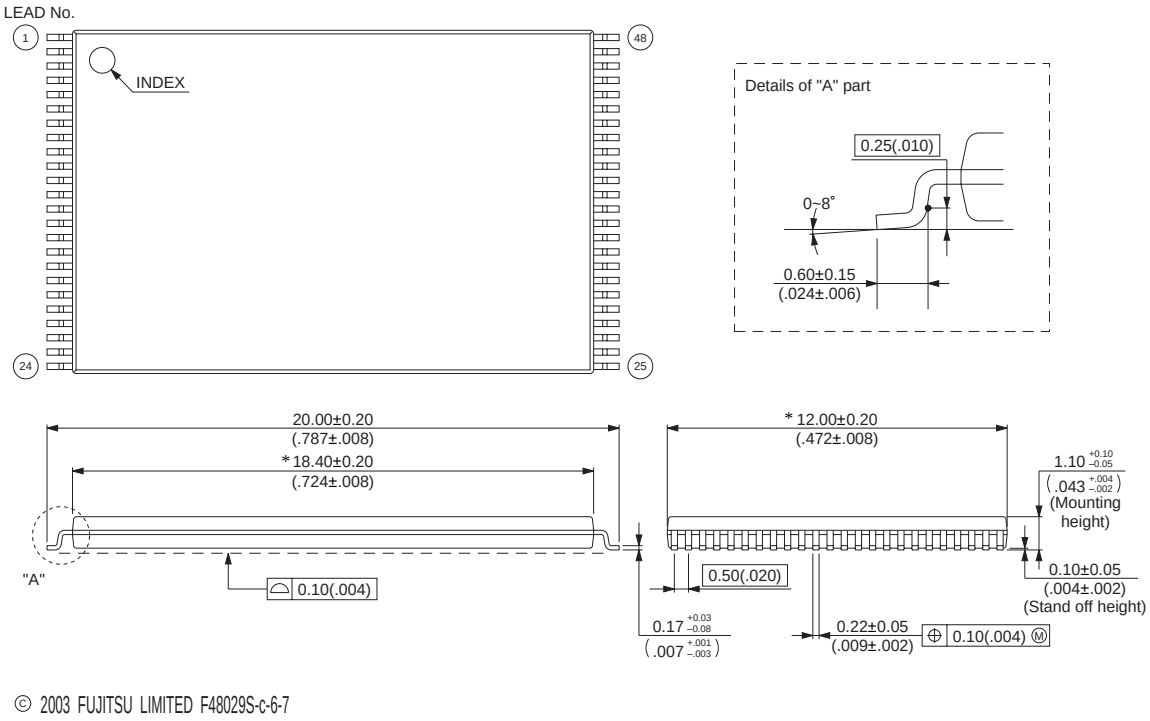
■ PACKAGE DIMENSIONS

48-pin plastic TSOP (1)
(FPT-48P-M19)

Note 1) * : Values do not include resin protrusion.
Resin protrusion and gate protrusion are +0.15 (.006) Max (each side) .
Note 2) Pins width and pins thickness include plating thickness.
Note 3) Pins width do not include tie bar cutting remainder.

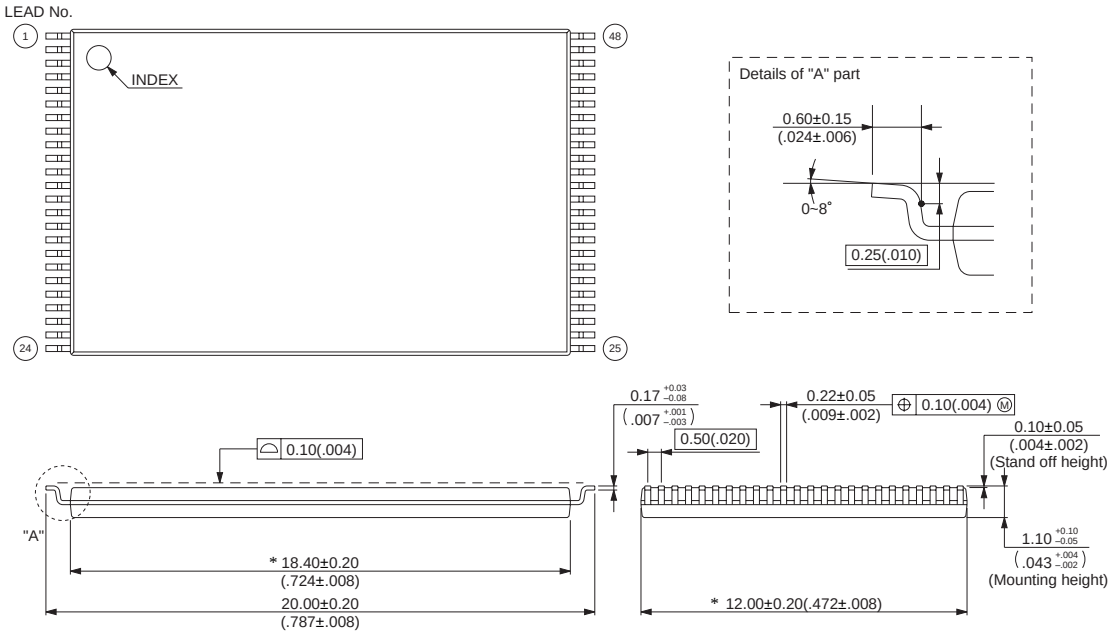


Dimensions in mm (inches)
Note : The values in parentheses are reference values.

(Continued)

48-pin plastic TSOP (1)
(FPT-48P-M20)

Note 1) * : Values do not include resin protrusion.
Resin protrusion and gate protrusion are +0.15 (.006) Max (each side) .
Note 2) Pins width and pins thickness include plating thickness.
Note 3) Pins width do not include tie bar cutting remainder.

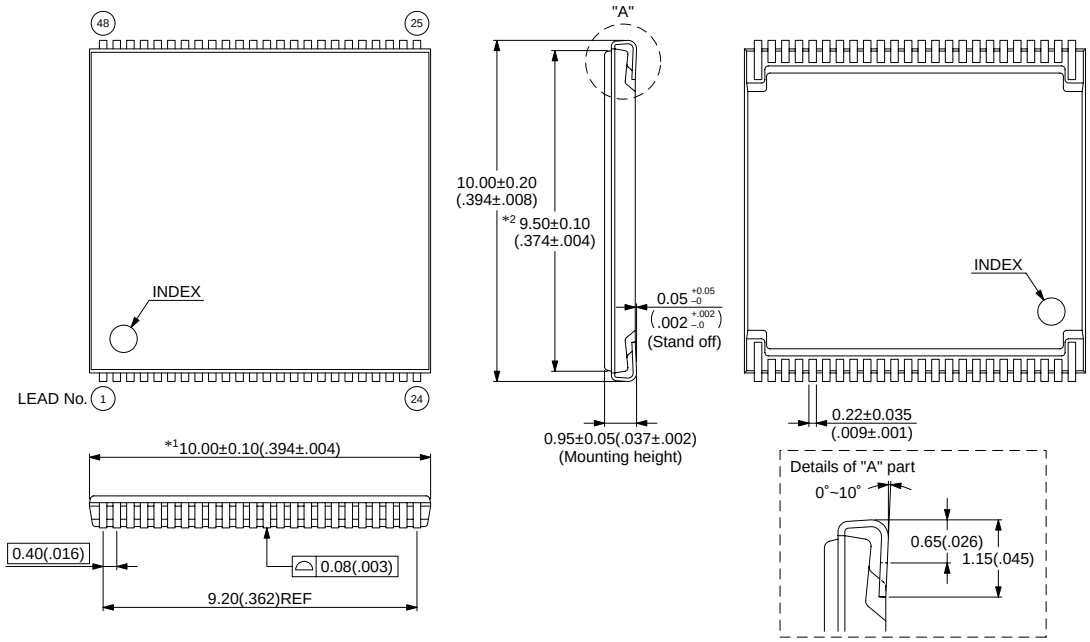


Dimensions in mm (inches)
Note : The values in parentheses are reference values.

(Continued)

48-pin plastic CSOP
(LCC-48P-M03)

Note 1) *1 : Resin protrusion. (Each side : +0.15 (.006) Max) .
Note 2) *2 : These dimensions do not include resin protrusion.
Note 3) Pins width includes plating thickness.
Note 4) Pins width do not include tie bar cutting remainder.

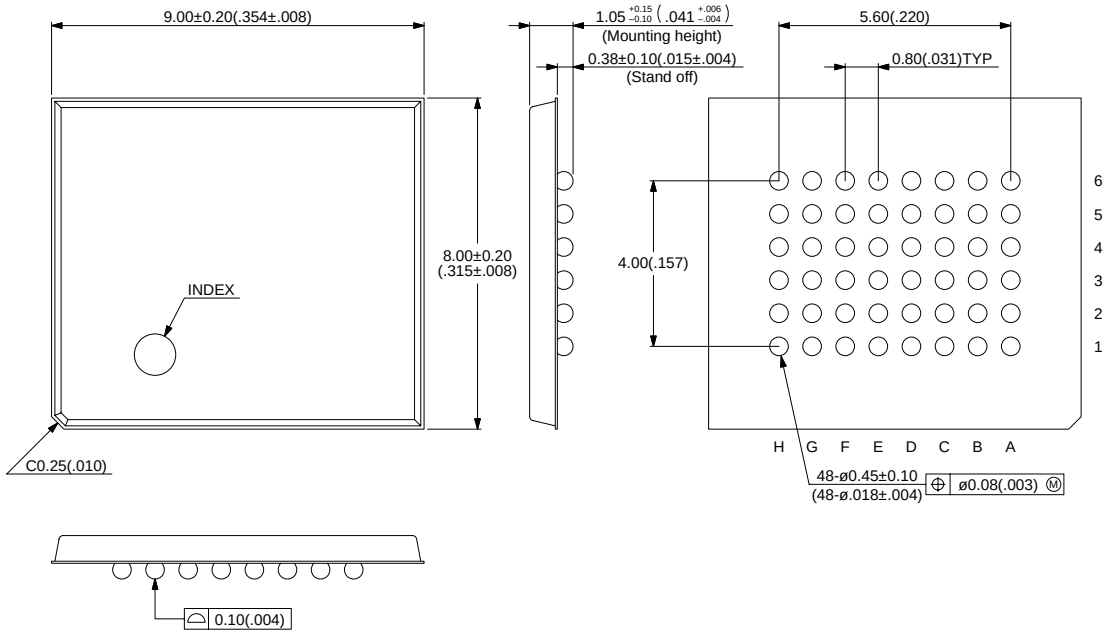


Dimensions in mm (inches)
Note : The values in parentheses are reference values.

(Continued)

(Continued)

48-ball plastic FBGA
(BGA-48P-M13)



Dimensions in mm (inches)
Note : The values in parentheses are reference values.

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information, such as descriptions of function and application circuit examples, in this document are presented solely for the purpose of reference to show examples of operations and uses of Fujitsu semiconductor device; Fujitsu does not warrant proper operation of the device with respect to use based on such information. When you develop equipment incorporating the device based on such information, you must assume any responsibility arising out of such use of the information. Fujitsu assumes no liability for any damages whatsoever arising out of the use of the information.

Any information in this document, including descriptions of function and schematic diagrams, shall not be construed as license of the use or exercise of any intellectual property right, such as patent right or copyright, or any other right of Fujitsu or any third party or does Fujitsu warrant non-infringement of any third-party's intellectual property right or other right by using such information. Fujitsu assumes no liability for any infringement of the intellectual property rights or other rights of third parties which would result from the use of information contained herein.

The products described in this document are designed, developed and manufactured as contemplated for general use, including without limitation, ordinary industrial use, general office use, personal use, and household use, but are not designed, developed and manufactured as contemplated (1) for use accompanying fatal risks or dangers that, unless extremely high safety is secured, could have a serious effect to the public, and could lead directly to death, personal injury, severe physical damage or other loss (i.e., nuclear reaction control in nuclear facility, aircraft flight control, air traffic control, mass transport control, medical life support system, missile launch control in weapon system), or (2) for use requiring extremely high reliability (i.e., submersible repeater and artificial satellite).

Please note that Fujitsu will not be liable against you and/or any third party for any claims or damages arising in connection with above-mentioned uses of the products.

Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Law of Japan, the prior authorization by Japanese government will be required for export of those products from Japan.
